NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
For better surface finish, reduce feed per tooth.

HARVI™ III Family

High-temperature alloy machining

- Profiling, semi-finishing, and finishing.
- Maximum metal removal rates in titanium and stainless steel.
- Supreme surface conditions.
- Complete family of square end, ball nose, and taper ball nose cutters.

KCSM15™

- Proprietary Beyond™ grade for exceptional tool life in titanium and stainless steels.

Advanced Technology

- Six unequally spaced flutes for chatter-free machining.
- Eccentric relief design increases tool life through higher edge stability.
- Proprietary tapered core provides highest tool stability in roughing and finishing operations.

Beyond™ EADE

Solid Ceramic End Mills

Primary Application

EADE solid ceramic end mills offer higher productivity and tool life in roughing nickel-based high-temperature alloys. Beyond grade KYS40™ delivers best-in-class tool life and exceptionally high Metal Removal Rates (MRR), surpassing those of other solutions on the market today.

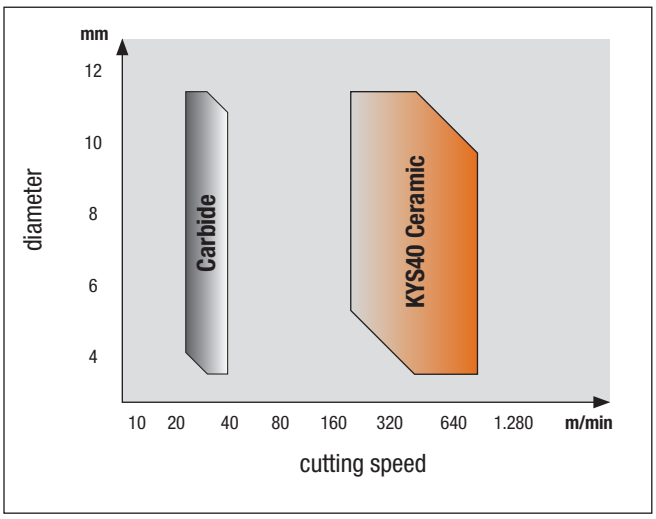
- Outstanding reduction of machining time.
- Fewer tool changes due to longer tool life.
- Benefit from throw away-type of tooling.

Features and Benefits

Advanced Technology

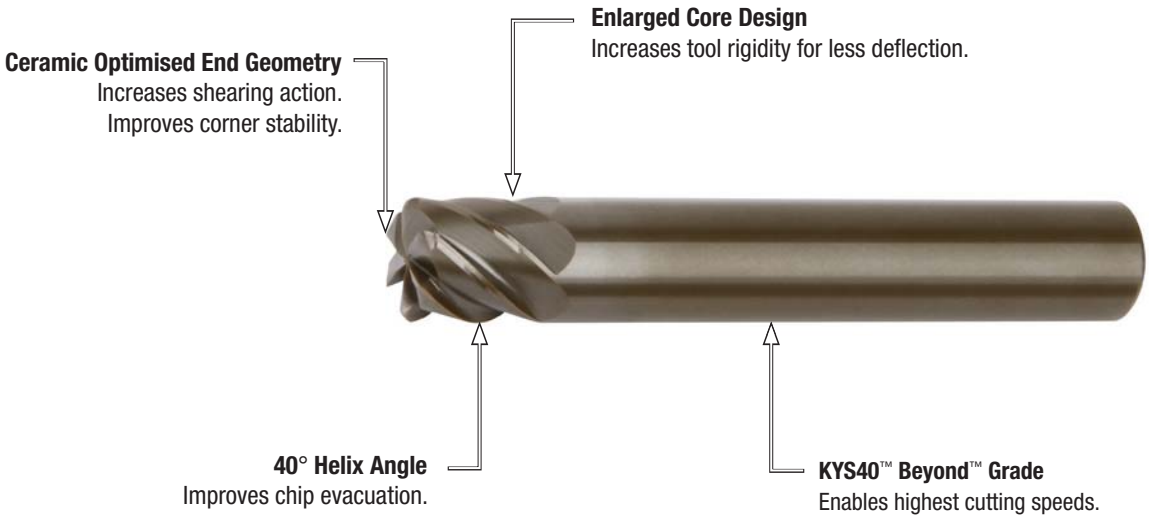
- KYS40 Beyond grade solid SiAlON ceramic designed for machining nickel-based high-temperature alloys.
- Cutting speeds up to 1000 m/min increase metal removal rates.
- Tool life up to 5x that of carbide end mills.

Extensive Standard Offering



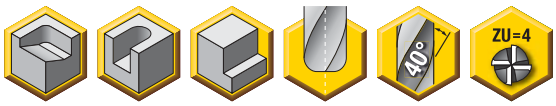
- 4-flute tooling for pocketing and slotting. Undersize end mills leaving stock for finishing operations.
- 6-flute tooling for face milling and profiling.

Customisation

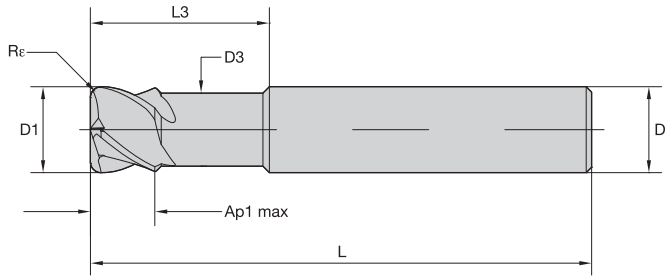


- Engineered solutions are available upon request.

Highest Cutting Speed Capability



- Increase compared to carbide.



Enlarged Core Design
Increases tool rigidity for less deflection.
Ceramic Optimised End Geometry
Increases shearing action.
Improves corner stability.
40° Helix Angle
Improves chip evacuation.
KYS40™ Beyond™ Grade
Enables highest cutting speeds.

- Kennametal standard dimensions.
- Non-centre cutting.
- Ramping up to 2,5°.
- Optimised geometry for roughing nickel-based high-temperature alloys.

NOVO KNOWS CAD/CAM

With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the tedious method of finding a tool in a catalogue, and then manually inputting the tooling information from the catalogue into the CAD/CAM software.

The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution. The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximises every shift. **kennametal.com/novo**

EADE 4-Flute End Mill

CHALLENGE

- Roughing a slot on turbine blade.
- Depth of slot 22mm
- INCONEL® 718 material.
- Dry machining.

SOLUTION

- Engineered solution EADE KYS40™ ceramic end mill with extended neck.
- Ø 11,4mm with 4 effective cutting edges and 1,5mm corner radii.

CUTTING DATA

- vc 800 m/min
- fz 0,03 mm/z
- ap 0,5mm
- ae 11,4mm

RESULT

- Customer proprietary information.

BENEFIT

- Machining time of 1 minute 54 seconds for one slot only.
- Metal removal rate of 15 cm^3/min consistently achieved.
- Productivity significantly increased.

EADE 4-Flute End Mill

CHALLENGE

- Rough profiling of small turbine blades.
- INCONEL 718 material.
- Dry machining.

SOLUTION

- Standard EADE KYS40 ceramic end mill.
- Ø 11,4mm with 4 effective cutting edges and standard neck.

CUTTING DATA

- vc 645 m/min
- fz 0,03 mm/z
- ap 0,5mm
- ae 11,4mm

RESULT

- 3x tool life compared to 2x tool life with competitive solution in less time.

BENEFIT

- 3x higher productivity as a result of increased cutting data.
- 50% longer tool life compared to competitive carbide end mill.

(continued)

(continued)

EADE 6-Flute End Mill

CHALLENGE

- Rough profiling of aerospace parts.
- Haynes® 288 and INCONEL® 718 material.
- Dry machining.

SOLUTION

- Standard EADE KYS40™ ceramic end mill.
- Ø 10mm with 6 effective cutting edges.

CUTTING DATA

- vc 462 m/min
- fz 0,03 mm/z
- ap 0,5–1mm
- ae Varying

RESULT

- Customer proprietary information.

BENEFIT

- Machining time reduced.
- Productivity significantly increased.

EADE 6-Flute End Mill

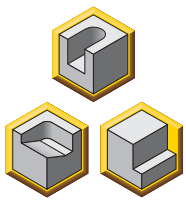
CHALLENGE

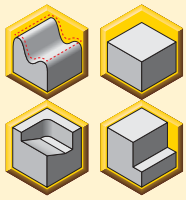
- Rough profiling of blisk (blade integrated disc).
- INCONEL 718 material (42 HRC).
- Compressed air coolant.

SOLUTION

- Standard EADE KYS40 ceramic end mill.
- Ø 12mm with 6 effective cutting edges.

CUTTING DATA





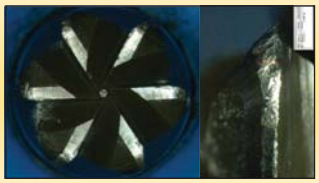
- vc 679 m/min
- fz 0,03 mm/z
- ap Varying up to 0,5mm
- ae Varying

RESULT

- 2 blisk segments machined with one tool.
- 12 minute machining time per segment.

BENEFIT

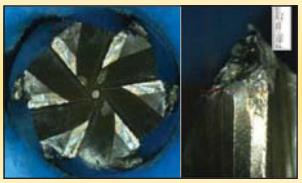
- Unprecedented reduction in machining time.



Materials to Cut	• Nickel-based high-temperature alloys. • Cobalt-based alloys after consulting technical assistance. • P6 and M1–3 stainless steels after consulting technical assistance. • Do not apply on iron-based high-temperature alloys.
Cutting Speed	• Maximum RPM machine can provide recommended cutting speed: 400–1000 m/min. • Highly dynamic machines recommended. • Use of spindle speeders applicable (no wet coolant).
Feed Rate	• Refer to application data recommendation. • General starting condition fz 0,03 mm/z.
Depth of Cut	• Refer to application data recommendation. • General starting condition ap 0,5mm.
Coolant	• Power cool nozzle preferred to flush chips away. • Pressurized air applicable. • Minimal quantity lubrication (MQL) and dry applicable. • No coolant with emulsion or oil due to thermal shock.
Adaptation	• Hydraulic chuck with or without sleeve preferred. • Collet or milling power chucks applicable. • Balancing at 25,000 RPM (2,5G) preferred.
Roughing Application	Yes
Finishing Application	No
Milling Strategy	• Conventional milling preferred at lower speeds. • Climb milling preferred at higher speeds.
4-Flute EADE	• Slotting and pocketing. • Common sizes and undersize leaving finishing stock. • Side milling possible up to ap max with increased feed. • Non-centre cutting. • Ramping and helical interpolation possible under 2.5°. 
6-Flute EADE	• Profiling and face milling. • Non-centre cutting. • Side milling possible up to ap max with increased feed. • Ramping and helical interpolation possible under 2°. 
Engineered Solutions	Available upon request.
Reconditioning Service	Not applicable.

Wear Indication

New



Used

Wear rate 0,48mm.
Still good to use.

End of Tool Life

Wear rate 1,4mm.
End of tool life reached.

Chip Formation

Carbide

Regular curled chips. Shape and length depend on end mill geometry and cutting data.

Ceramic

Chips are nearly like dust. Pressurised air coolant recommended to blow away chips.

Causes of and Remedies for End Milling Problems

problem	cause	remedy
Excessive bur formation	• Softness of material to cut. • Excessive wear on radii.	• Use undersize end mills that leave stock for finishing operation. • Replace tool as end of tool life reached. • Check tool runout.
Sudden breakage	• Vibration of the workpiece. • Unstable tool clamping. • Use of 6-flute tooling in slotting.	• Check workpiece and tool clamping. • Use of 4-flute EADE recommended.
Chips sticking	• Lack of cutting speed.	• Increase cutting speed.
Chipping	• Unstable tool and/or workpiece clamping. • Initial cutting speed too high.	• Check workpiece and tool clamping. • Reduce cutting speed during initial cut and increase as cutting continues.
Thermal cracks	• Wet coolant.	• Do not use wet coolant.

KC643M™ Key Way Cutter

Primary Application

F2AU and F3AU Key Way Cutters offer highest precision when machining slots for a shaft to hub connection. The corner radii increases workpiece durability as crack causing forces between floor and wall are minimised. To produce key slots according to ISO, the radii are adjusted accordingly to match this standard.

New KC643M Key Way Cutters replace old KC635M™ and KC625M™ versions.

- Highest accuracy with finishing (conventional milling).
- Roughing and finishing with one tool.
- Less tool changes due to higher tool life.

Features and Benefits

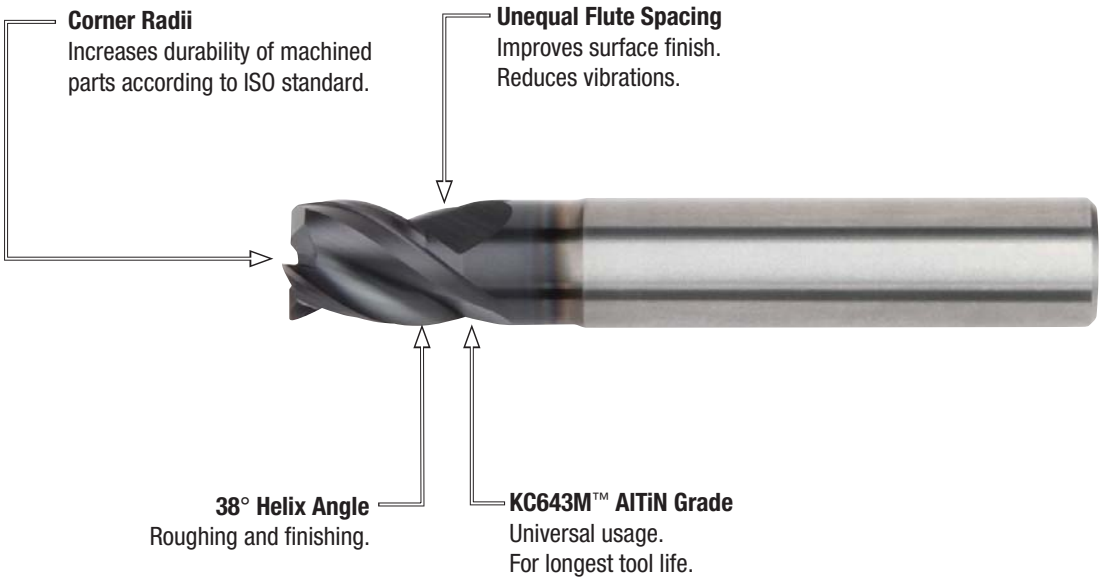
Advanced Technology

- Unequally spaced flutes with F3AU for chatter-free machining at high feed rates.
- F2AU designed for unstable machining conditions.
- Radii transition created between floor and wall at key slot increases durability of machined components by preventing cracks.
- True 90° wall straightness due to tapered peripheral edges creating a defined passive force during finishing cut (conventional cut).
- Roughing and finishing with one tool resulting in fewer tool changes and less tooling inventory necessary.

Tailored Grade

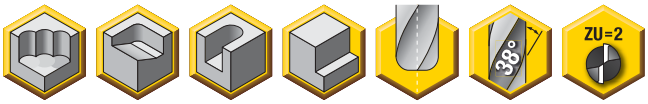
- Universal KC643M grade suitable for cutting steel, cast iron, stainless steel (wet), and titanium (wet).

Customisation



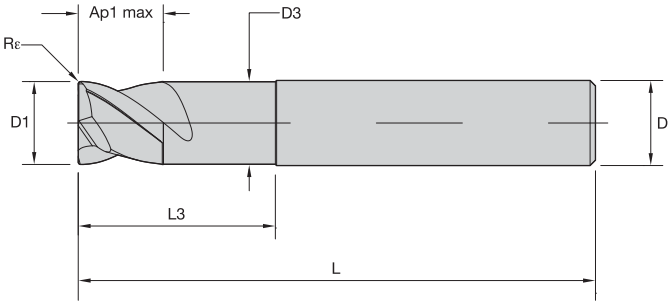
- Expanded length of tool as well as increased length of cut are possible.
- Internal coolant axial as well as radial available.
- Various shank and non-standard coatings options available.

Extensive Standard Offering



- Diameter range 1,80–19,70mm.
- 2-flute and 3-flute tooling in stock.

Various shank and non-standard coating options available.



- Kennametal standard dimensions.
- Centre cutting.
- Single tool for roughing and finishing applications requiring fewer setups.
- Optimised for unstable machining conditions.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centres, please adjust parameters accordingly on >12mm diameter.

NOTE: Those guidelines may require variations to achieve optimum results.
Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centres, please adjust parameters accordingly on >12mm diameter.

GOmill™

Economical High-Performance End Mills

Primary Application

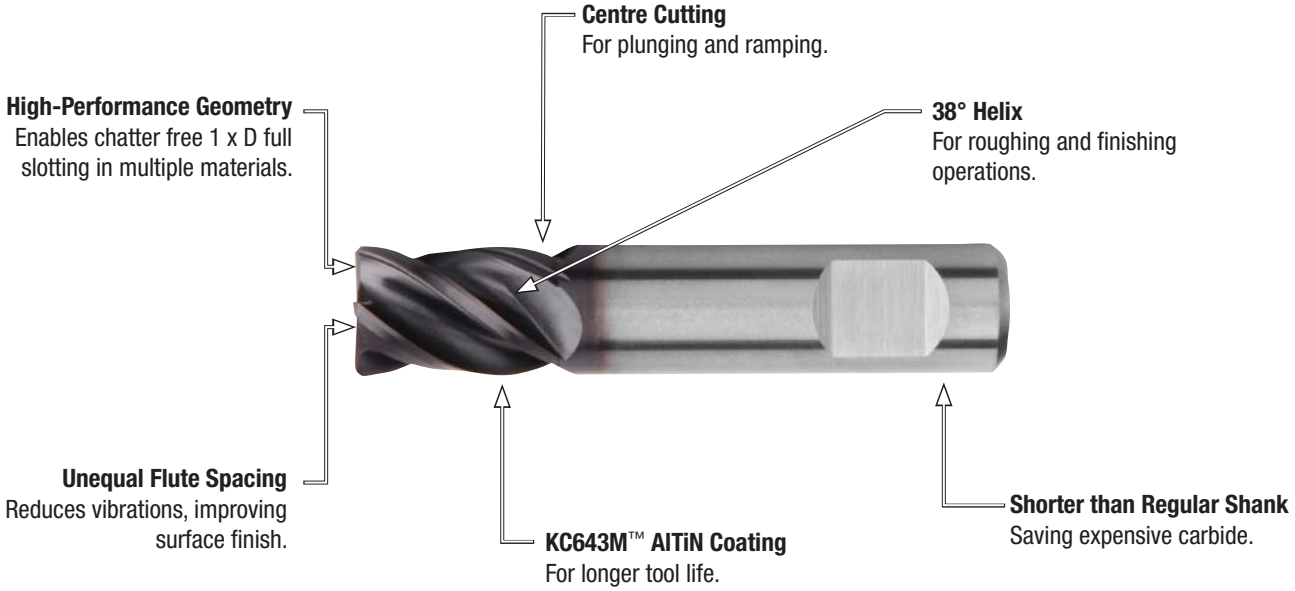
The GOmill line is specifically engineered to work on short length-of-cut applications in multiple workpiece materials, like soft and hard steels up to 48 HRC, stainless steels, high-temperature alloys, and cast iron. With the very short overall length and soft cutting geometries, this line is made to conform to the growing market of mill-turn machines.

- Extremely stable cutting tool due to extremely short design.
- Less vibration due to unequal flute spacing.
- Soft cut to support mill-turn machines as well driven units in lathe tooling.
- Use a new GOmill with 100% performance instead of regrinding.

Features and Benefits

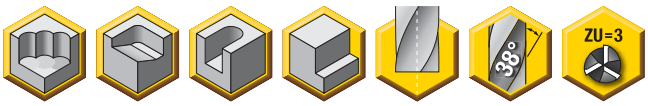
Advanced Technology

- The 3-flute sharp and 4-flute chamfer versions support roughing, semi-finishing, and finishing applications.
- The 3-flute ball nose tool supports roughing and semi-finishing applications.
- All geometries work in slotting and side milling applications up to 1 x D depth of cut.
- Shortened shank applicable for all common clamping adaptors without modifications. Only use clamping sleeve in hydraulic chucks to avoid vibrations.



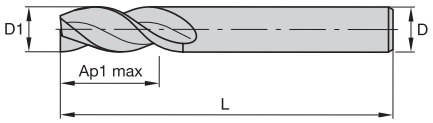
Tailored Grades

- Universal KC643M™ grade suitable for cutting steel, cast iron, stainless steel (wet), and titanium (wet).



Extensive Standard Offering

- Diameter ranges 2 to 12mm.
- Straight and adapted Weldon® shanks.



Centre Cutting
For plunging and ramping.
High-Performance Geometry
Enables chatter free 1 x D full slotting in multiple materials.
38° Helix
For roughing and finishing operations.
Unequal Flute Spacing
Reduces vibrations, improving surface finish.
KC643M™ AlTiN Coating
For longer tool life.
Shorter than Regular Shank
Saving expensive carbide.

- Kennametal standard dimensions.
- Centre cutting.
- Unequal flute spacing.
- Roughing/finishing.

● first choice

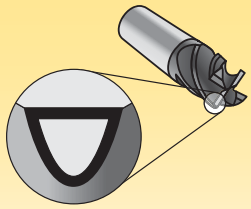
◑ suitable with limitations

○ not recommended

Always select a tool with the shortest possible flute length whenever possible. This will increase the stability of the tool and give the best results.

When selecting an end mill, the following machining factors will affect your selection of the correct end mill for your application:

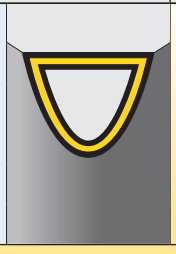


1. Tool overhang.
2. Coolant flow.
3. Machine and setup stability.
4. Machine power and torque.
5. Material to be machined.
6. Machine adaptor size (DV40, DV50, HSK63, etc.).

Select Adaptor per Technical Data/Characteristics

Technical data/characteristics	Toolholders				
	HydroForce™ high torque	Shrink Fit	Milling chuck	ER collet chuck	Weldon® adaptor
torque transmission	★★★★★	★★★★	★★★★★	★★	★★★★★
radial runout (T.I.R.)[1]	★★★★★	★★★★★	★★★★	★★★	★
radial rigidity[2]	★★★★	★★★★★	★★★	★★★	★★★
tool length adjustment	★★★★★	★★★★	★	★★★★	★★
tool shank tolerance requirement	★★★★	★★	★★★	★★★★★	★★★
through coolant	★★★★★	★★★★★	★★★	★★★	★★
minimum quantity lubrication (MQL)	★★★★★	★★★★★	★	★	★
dampening capability	★★★★★	★	★★★	★★★	★★★
shank diameter range[3]	★★★★★	★	★★★★★	★★★★★	★
cost of toolholder	★★	★★★	★	★★★★	★★★★★
low requirement of external devices[4]	★★★★★	★	★★★★	★★★★	★★★★★
ease of handling	★★★★★	★★★	★★	★★★★	★★★★
dust resistance	★★★★★	★★★★★	★★★	★★★	★★★★
high-speed capability	★★★★★	★★★★★	★★★	★★★	★
balancing accuracy	★★★★★	★★★★★	★★★	★★★	★

[1] Radial runout may affect tool life.
[2] Radial rigidity for Weldon holder is low at a direction perpendicular to the screw.
[3] Accepts different shank diameters through the use of reduction sleeves or due to collapse range.
[4] Collet chucks and milling chucks may require the use of a torque or special wrench; Shrink Fit adaptor requires a shrinking unit.



Grades and Grade Descriptions

Coatings provide high-speed capability and are engineered for roughing to finishing.

Grade	Coating	Grade Description		05	10	15	20	25	30	35	40	45
KC633M		Coated carbide grade with PVD multilayer coating. KC633M™ is designed for dry milling most types of material, apart from the hardened variety. This grade is characterised by high hardness and wear resistance. It provides outstanding protection for solid carbide tools against cratering and abrasion.	P

GOmill™ GP General Purpose Solid Carbide End Mills · 2 Flute

Primary Application

The GOmill GP series offers plunging, slotting, and profiling with long tool life on a wide range of workpiece materials. They are designed to provide high Metal Removal Rates (MRR) and achieve good surface quality at an excellent cost-benefit ratio. A wide range of diameters and lengths are available with chamfered edge and ball nose as stocked standard.

- Roughing and finishing with one tool.
- Excellent cost-benefit ratio.
- Multilayer KC633M™ grades for high tool life.

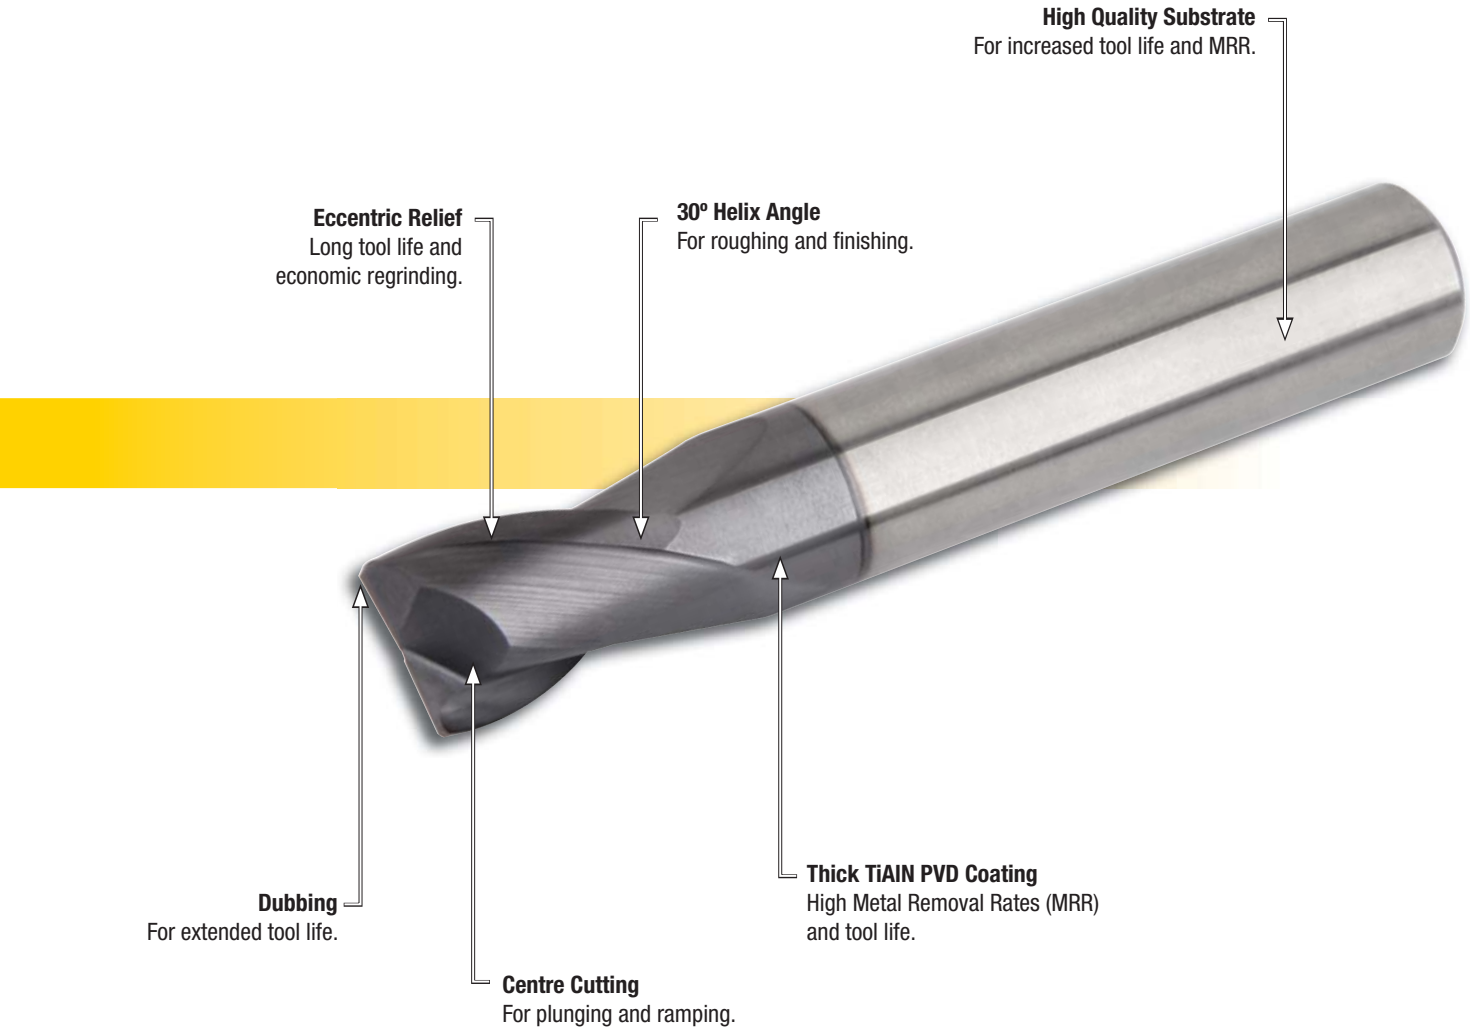
Features and Benefits

Advanced Technology

- Roughing and finishing with one tool reduces tool changes and unnecessary tooling inventory.
- Eccentric relief increases edge stability for longer tool life and better surface quality.
- Eccentric relief eases regrinding and reduces reconditioning cost.
- 2-flute design for unstable conditions and high flexibility.

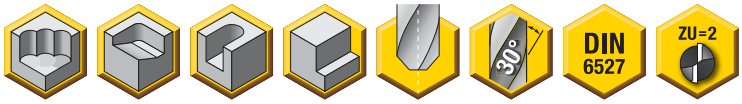
Tailored Grades

- Universal multilayer KC633M coating for cutting steel, cast iron, and stainless (wet).

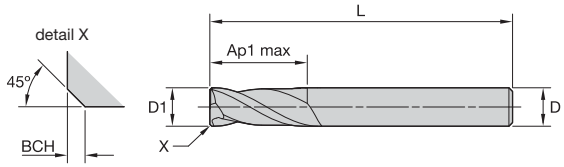


Customisation

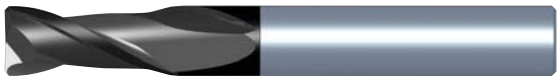
- Intermediate diameters available.



Extensive Standard Offering



- Diameter range 1–20mm.
- Chamfered edge and ball nose as standard offering.



Designed for roughing and finishing with one tool at a value price.

- Centre cutting.

GOmill™ GP General Purpose Solid Carbide End Mills · 3 Flute

Primary Application

The GOmill GP series offers plunging, slotting, and profiling with long tool life on a wide range of materials. Designed to provide high Metal Removal Rates (MRR) and to achieve good surface conditions at excellent cost-benefit ratio. A wide range of diameters and lengths with sharp edge are available from stock.

- Roughing and finishing with one tool.
- Excellent cost-benefit ratio.
- Multilayer KC633M™ grades for long tool life.

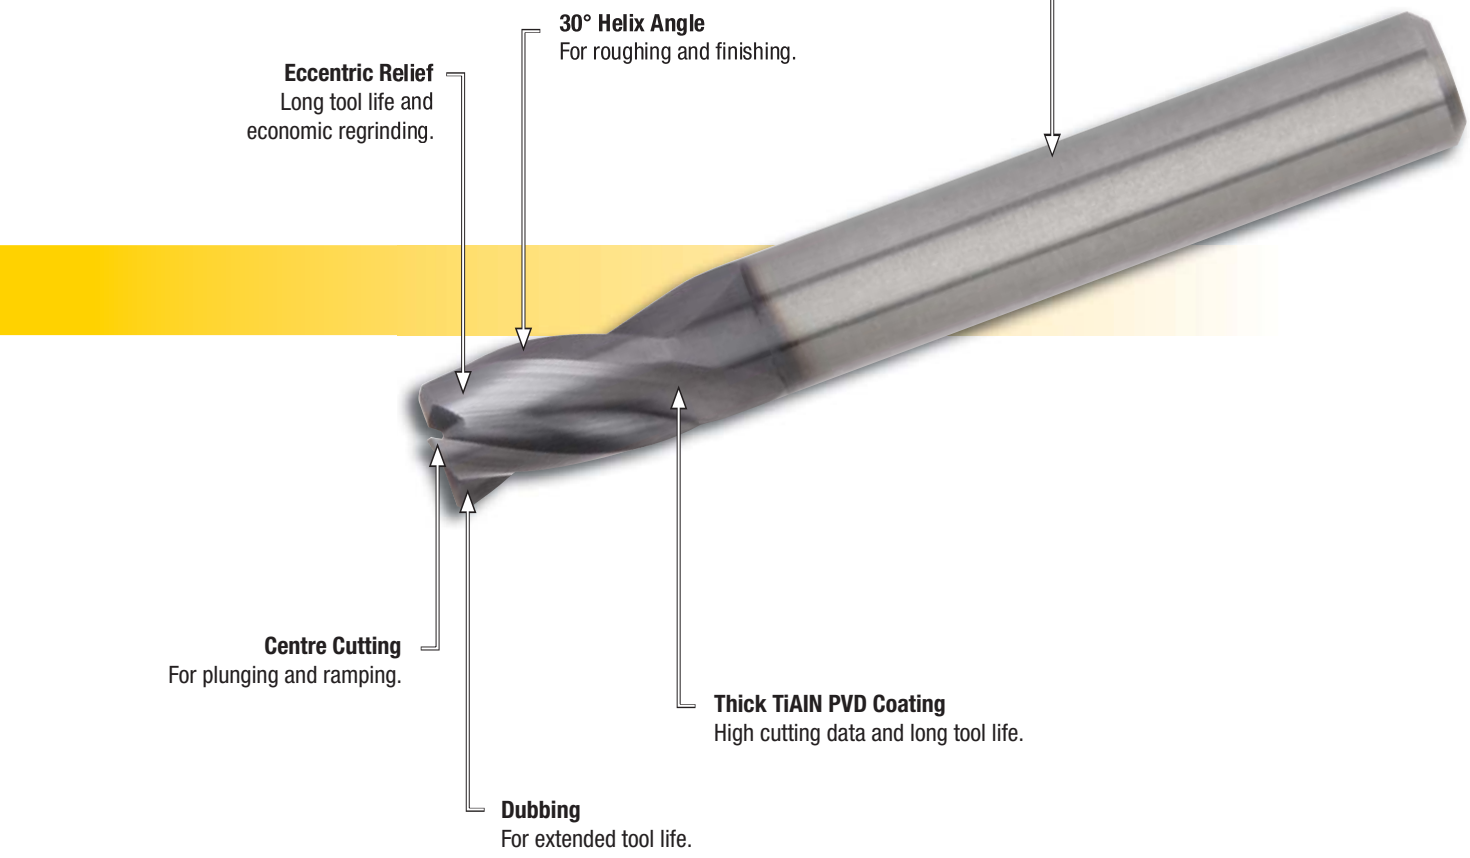
Features and Benefits

Advanced Technology

- Roughing and finishing with one tool reduces tool changes and unnecessary tooling inventory.
- Eccentric relief increases edge stability for longer tool life and better surface quality.
- Eccentric relief eases regrinding and enables higher flexibility and lower reconditioning cost.
- 3-flute design for maximum manufacturing flexibility.

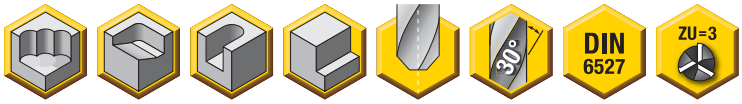
Tailored Grade

- Universal multilayer KC633M coating for cutting steel, cast iron, and stainless steel (wet).

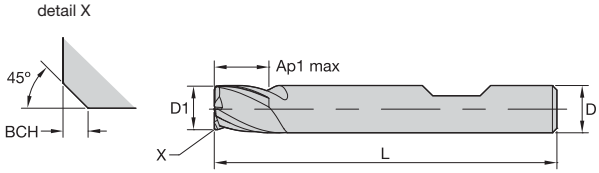


Customisation

- Intermediate diameters available.



Extensive Standard Offering



- Diameter range 1–20mm.
- Chamfered edge as standard offering.
- Four different lengths as DIN and factory standards in stock.

Designed for roughing and finishing with one tool at an economical price.

• Centre cutting.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centres, please adjust parameters accordingly on diameters >12mm.

GOmill™ GP General Purpose Solid Carbide End Mills · 4 Flute

Primary Application

The GOmill GP series offers plunging, slotting, and profiling with long tool life in a wide range of workpiece materials. These end mills are designed to provide high Metal Removal Rates (MRR) and to achieve good surface quality at an excellent cost-benefit ratio. A wide range of diameters and lengths are available with chamfered edge and ball nose as stocked standard.

- Roughing and finishing with one tool.
- Excellent cost-benefit ratio.
- Multilayer KC633M™ grades for long tool life.

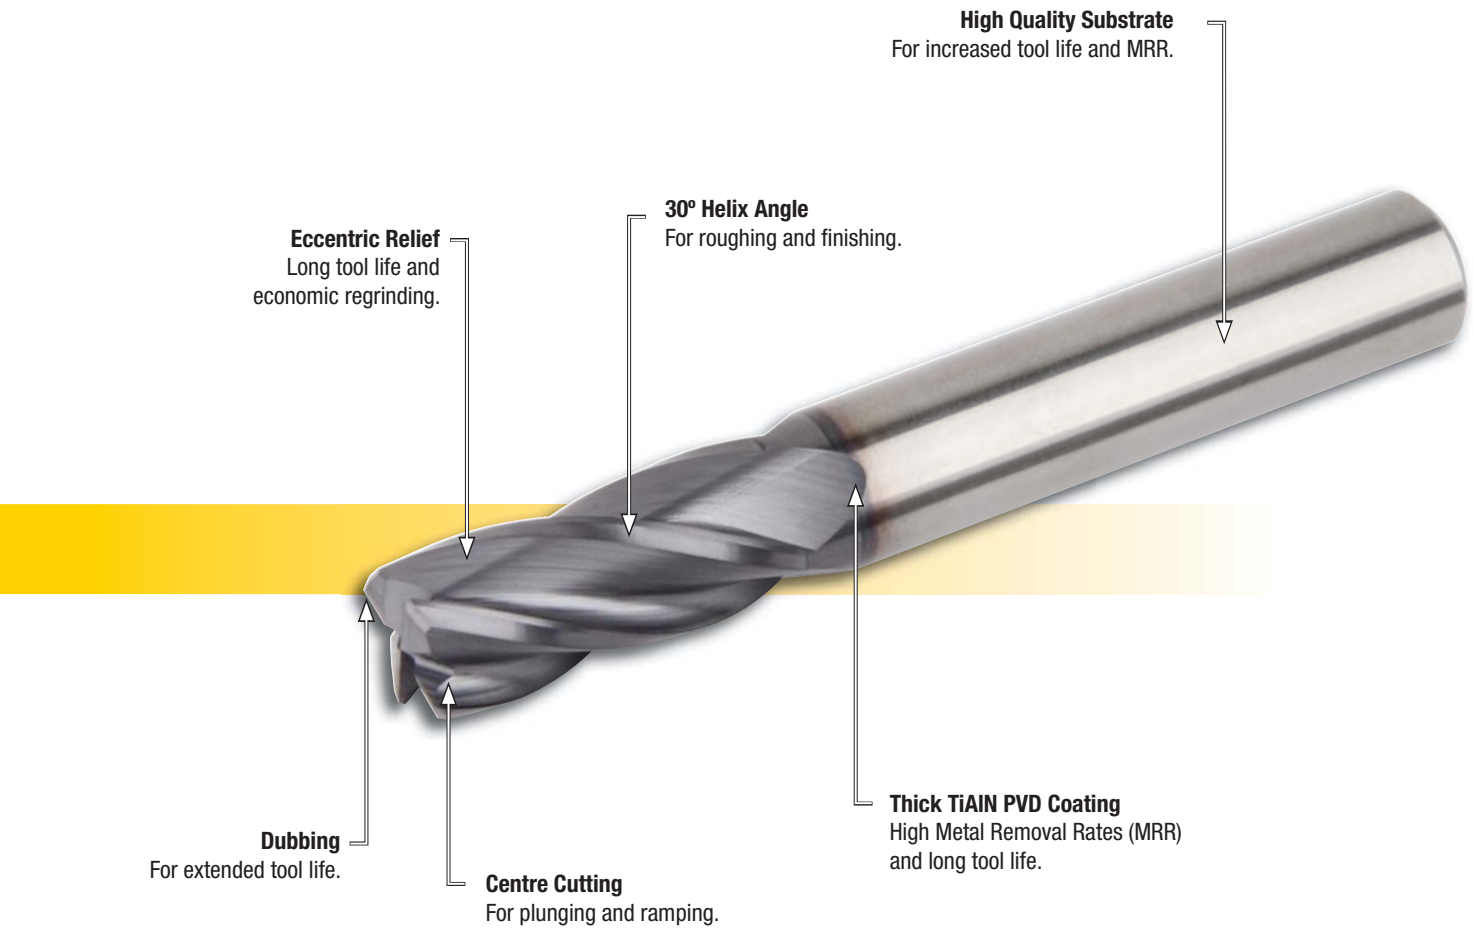
Features and Benefits

Advanced Technology

- Roughing and finishing with one tool reduces tool changes and unnecessary tooling inventory.
- Eccentric relief increases edge stability for longer tool life and better surface quality.
- Eccentric relief eases regrinding and reduces reconditioning cost.
- 4-flute design for high MRR and reduced machining time.

Tailored Grades

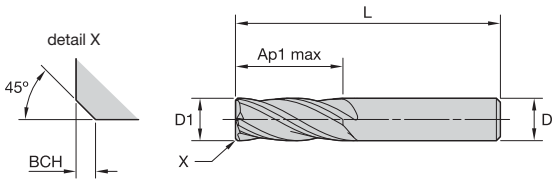
- Universal multilayer KC633M coating for cutting steel, cast iron, and stainless steel (wet).



Customisation

- Intermediate diameters available.

Extensive Standard Offering



- Diameter range 2–20mm.
- Chamfered edge and ball nose as standard offering.

Designed for roughing and finishing with one tool at a value price.

• Centre cutting.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centres, please adjust parameters accordingly on >12mm diameter.

NOTE: Lower value of cutting speed is used for high stock removal applications or for higher hardness (machinability) within group.
Higher value of cutting speed is used for finishing applications or for lower hardness (machinability) within group.
Above parameters are based on ideal conditions. For smaller taper machining centres, please adjust parameters accordingly on >12mm diameter.

How Do Catalogue Numbers Work?

Each character in our catalogue number signifies a specific trait of that product. Use the following key columns and corresponding images to easily identify which attributes apply.

3	CH	1200	DK	012	A
Number of Flutes	End Mill Shape	Cutting Diameter mm	Standard	Ap1 max mm	Shank Style
2 = 2 Flute **3** = 3 Flute **4** = 4 Flute	**CH** = Chamfer Edge **BN** = Ball Nose		**DK** = DIN 6527 Short **DL** = DIN 6527 Long **DD** = DIN 6528 **MS** = Factory Standard Short **MR** = Factory Standard Regular **ML** = Factory Standard Long **MX** = Factory Standard Extra Long		**A** = Plain Shank **B** = Weldon® Shank

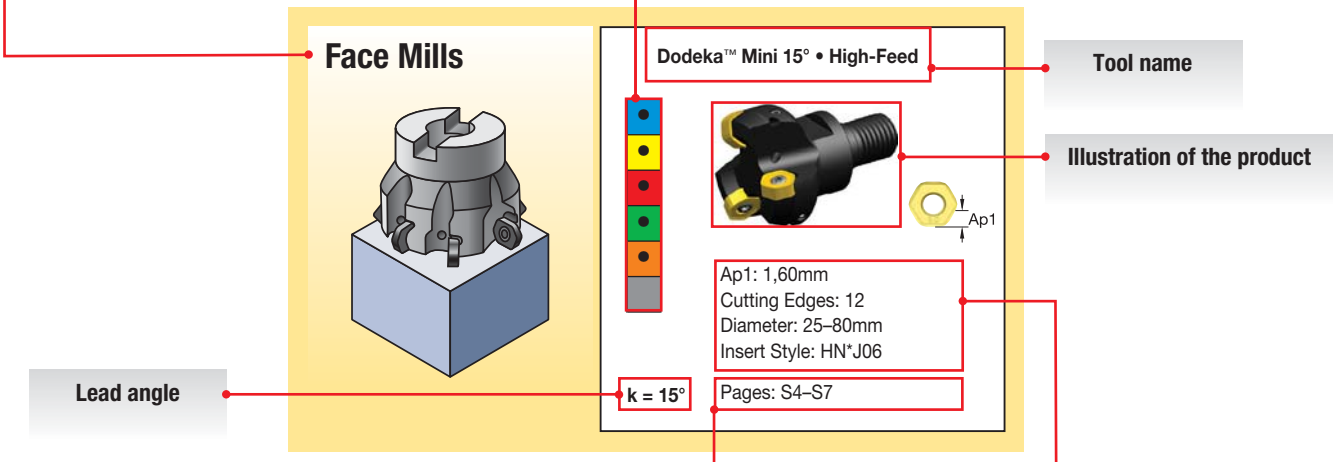
The Most Advanced Milling Solutions in the Industry

For unsurpassed quality, value, and performance, you can trust Kennametal to provide the most comprehensive line of reliable metalcutting tools. Whatever your indexable milling product requirements, be assured that you will find the appropriate solution in this all-inclusive, easy-to-use guide.

For every milling application, workpiece, or equipment need, we offer the best tools on the market, designed to reduce your machining time, provide superior surface finishes, and exceed your expectations!

Identify material to be machined:



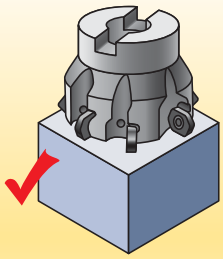
Each tool has a material grid marked with a letter indicating the materials that can be machined.

● first choice
○ alternate choice

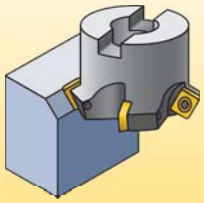
P	○	Steel
M	●	Stainless Steel
K		Cast Iron
N		Non-Ferrous
S	○	High-Temp Alloys
H	○	Hardened Materials

Choose your application:

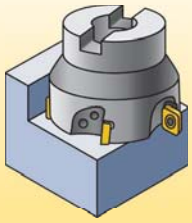
- Face Milling
- Chamfer Milling
- Shoulder Milling
- Slotting
- Copy Milling
- Ceramic Milling
- Thread Milling



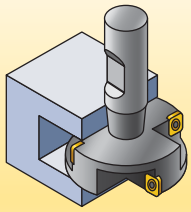
Location of introduction detail, tool bodies, inserts, and cutting data.



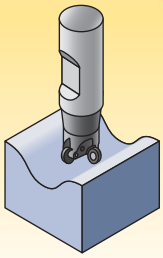
Select tool based on maximum depth of cut and diameter required:



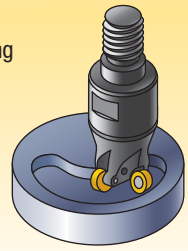
Information is given in this area to provide specific detail as a quick reference.



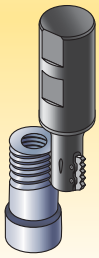
How to Navigate the 2018 Catalogue



Step 1 • Select Application



Face Milling



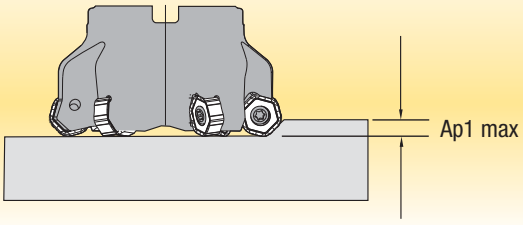
Chamfer Milling

Shoulder Milling (End Milling)

Slotting

Copy Milling

Ceramic Milling



Thread Milling

Step 2 • Select Workpiece Material

● first choice
○ alternate choice

ISO Description			Material Group	
Steel	P	●	P1–P2	Carbon steels
			P3–P4	Alloy steels and tool steels
			P5–P6	Ferritic, martensitic, and PH stainless steels
Stainless Steel	M	●	M1–M2	Austenitic stainless steels
			M3	Duplex stainless steels (ferritic and austenitic mixture)
Cast Iron	K		K1–K2	Grey, ductile, CGI, and malleable cast irons >80 KSI
			K3	Ductile, CGI, and malleable cast irons >80 KSI
Non-Ferrous Materials	N		N1–N2	Aluminium alloys <12.2% Si
			N3	Aluminium alloys >12.2% Si
High-Temp Alloys	S	●	S1–S2	Iron- and cobalt-based heat-resistant alloys
			S3	Nickel-based heat-resistant alloys
			S4	Alpha-Beta titanium alloys
Hardened Materials	H	○	H1	Hardened steels and irons

Step 3 • Select a Maximum Axial Depth of Cut (Ap)

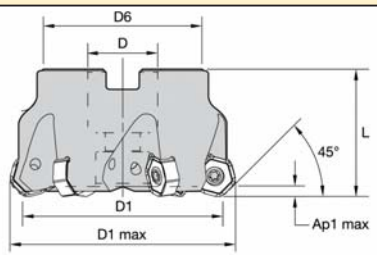
(continued)

How to Navigate the 2018 Catalogue *(continued)*

Step 4 • Select Milling Cutter from Application Selector

Face milling 1

Material 2



Ap1: 3,2mm
Cutting Edges: 12
Diameter: 25–125mm
Insert Style: HN*J06
Pages: S8–S13

k = 45°

3 Axial depth of cut

5

(continued)

How to Navigate the 2018 Catalogue *(continued)*

Step 6 • Insert Chart, Providing the Inserts and Grades

HNPJ-GD

catalogue number	D	BS	L10	Rε	S	hm	cutting edges
HNPJ0604ANSNGD	12	1,45	6,44	1,0	4,45	0,08	12

Step 7 • Defining the Feed per Tooth

Geometry (S.GD)
20% radial width of cut, follow arrows for value.
% = radial width of cut (Ae) ÷ cutter diameter (D1)
Using a round or ball nose insert, consider the axial depth of cut; see separate chart on the cutter page.

Recommended Starting Feeds [mm]

Light Machining	General Purpose	Heavy Machining

Insert Geometry	Recommended Starting Feed per Tooth (Fz) in Relation to % of Radial Engagement (ae)															Insert Geometry
	5%			10%			20%			30%			40-100%			
.F..LDJ	0,17	**0,46**	0,79	0,12	**0,33**	0,57	0,09	**0,25**	0,43	0,08	**0,22**	0,37	0,07	**0,20**	0,34	.F..LDJ
.E..LD	0,18	**0,59**	0,99	0,13	**0,43**	0,71	0,10	**0,32**	0,53	0,09	**0,28**	0,46	0,08	**0,25**	0,42	.E..LD
.S..GD	0,33	**0,79**	1,19	0,24	**0,57**	0,86	0,18	**0,43**	0,64	0,16	**0,37**	0,56	0,14	**0,34**	0,51	.S..GD
.S..HD	0,33	**0,84**	1,35	0,24	**0,**	0,97	0,18	**0,45**	0,72	0,16	**0,39**	0,63	0,14	**0,36**	0,57	.S..HD

7

Always consider starting with the "Light Machining" value. Once established, increase the feed per tooth from the chart.
These are minimum values and can be increased when the application has been proven.
Light Machining — Low Feed Rate, High Speed
General Purpose — Normal Feed, Normal Speed
Heavy Machining — Higher Feed, Reduced Speed

Step 8 • Recommended Starting Speeds [m/min]

8

Grades

Coating	Grade Description	wear resistance ⟷ toughness: 05	10	15	20	25	30	35	40	45
GH1	Uncoated submicron carbide grade with high wear resistance. GH1 is suitable for machining of aluminium and non-ferrous materials. Also a good choice for the finishing of cast iron. This grade can be used both wet and dry and is designed for light and general machining.	K, N	K, N	K, N						
GH2	Uncoated, fine grained carbide grade with good strength. GH2 is suitable for machining of aluminium and non-ferrous materials. Also good choice for cast iron for medium toughness requirements. This grade can be used both wet and dry and is designed for light and general machining.				K, N, S	K, N, S	K, N			
K110M	Uncoated carbide grade K110M is a universal grade for machining non-ferrous material. For use in light and general machining. K110M can be used with or without coolant.		K, N, S	K, N, S	N					
K115M	Uncoated carbide grade. K115M is a premium uncoated grade designed for high edge-wear resistance in non-ferrous and cast iron materials. Recommended to be used with coolant.		K, N	K, N						
K313	Uncoated carbide grade. K313 is suitable for machining cast iron, high-temperature alloys and non-ferrous materials. This grade can be used both wet and dry and is designed for light and general machining.		K, N, S	K, N, S						
KBK50	A high CBN content, PcBN tip brazed onto a carbide insert. Designed to machine at highest speeds and tool life on semi-finishing and finishing cast iron materials.		K	K						
KC410M	PVD, TiB_2 coating on grade KC410M is extremely hard and provides very good wear characteristics at higher cutting speeds. KC410M resists built-up edge, can help reduce burring, and generates excellent surface finishes. The grade is best suited for aluminium with <10% silicon and other non-ferrous materials.		N	N						

Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

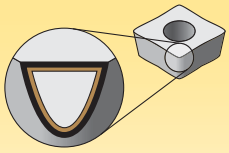
wear resistance ← → **toughness**

Grades

Coating	Grade Description		05	10	15	20	25	30	35	40	45
KC422M	The PVD TiB_2 coating is very wear resistant. Together with hard coating and a tough substrate, this is an excellent combination for medium to roughing applications in aluminium <10% silicon and other non-ferrous materials.	N									
KC505M	Coated carbide with PVD TiAlN. KC505M is a highly wear-resistant grade; primarily used for light maching applications in steel and hardened steels.	P									
		H									
KC510M	Coated carbide grade with a TiAiN coating (PVD). KC510M is a highly wear-resistant grade primarily for use in milling aluminium and high-temperature alloys in light applications. Can also be used for machining of steel and hardened steel.	P									
		N									
		S									
		H									
KC514M	Coated carbide grade with a thicker PVD TiAlN coating. KC514M combines high wear resistance with good toughness. Primarily for light to medium machining of cast irons. This grade can be used both wet and dry.	K									
KC515M	Premium-coated grade K10 substrate with built-in wear resistance and (TiAlN) coating for extended life during finishing applications. Used in finish ball nose and back draft inserts for the die and mould industry. Capable of running at moderate to high cutting speeds.	P									
		M									
		K									
KC520M	Coated carbide grade with TiAlN coating (PVD). KC520M is a carbide grade developed specifically for general machining of ductile cast iron. This grade can be used with or without coolant.	K									
KC522M	Coated carbide grade with a AlTiN (PVD) coating. KC522M is engineered to provide better performance in general machining of high-temperature alloys and stainless steel. KC522M resists breakage and offers improved wear resistance and increased strength.	P									
		M									
		K									
		S									



Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

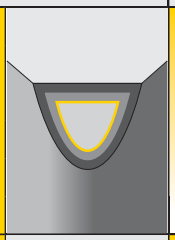
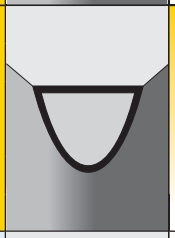
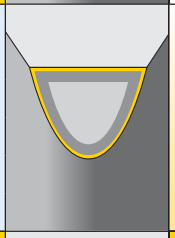
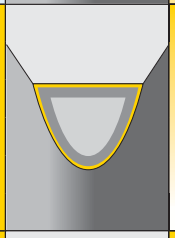
Grades

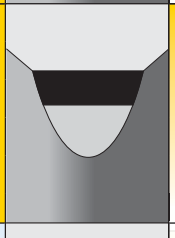
Coating	Grade Description	wear resistance ← → toughness	05	10	15	20	25	30	35	40	45
KC524M	Coated carbide grade with a thicker PVD TiAlN coating. KC524M combines good wear resistance with high toughness. Primarily for general machining of all cast irons. This grade can be used both wet and dry.	K				■	■	■	■		
KC525M	Coated carbide grade with a TiAlN coating (PVD). New universal carbide grade for milling steel, stainless steel, and high-temperature alloys. KC525M can be used with or without coolant. Primarily for use in light and general machining.	P M S				■ ■ ■	■ ■ ■	■ ■ ■			
KC530M	Premium PVD-coated carbide grade (P40) with a TiAlN coating. Enables extended tool life at moderate feeds and high cutting speeds. First choice for milling in all steels, including die and mould steels. Recommended for use without coolant.	P M					■ ■	■ ■	■		
KC725M	Coated carbide grade with an advanced PVD TiAlN coating. KC725M is a high-performance grade for milling steel, stainless steel, and ductile cast iron. The good thermal shock resistance of the substrate makes this grade ideal for both wet and dry machining. Primarily for use in general and heavy machining.	P M S						■ ■ ■	■ ■ ■	■ ■ ■	
KC735M	PVD/TiN coated carbide grade. This grade offers an unusual combination of high toughness and wear resistance. Even under extreme toughness requirements, it achieves outstanding results in general and heavy-machining applications. Suitable for dry and wet machining.	P M						■ ■	■ ■	■	
KCK15	Coated carbide grade with CVD multilayer coating (TiN/MT TiCN/Al_2O_3) and advanced Beyond™ post-coat treatment. KCK15 is a wear-resistant grade with balanced toughness for general milling of cast irons at higher speeds. Best results in dry, but can also be used wet.	K		■	■	■					
KCK20	A new PVD multilayer AlTiN + AlCrN coated carbide with an excellent combination of wear resistance and coating strength. The KCK20 grade is specifically engineered to maximise coating adhesion and edge strength, making this grade ideal in wet interrupted cutting of gray and ductile irons, and can also be used in dry conditions. It can be used in a wide range of applications, from finishing to roughing, to maximise productivity wherever strength and reliability are needed.	K		■	■	■	■				

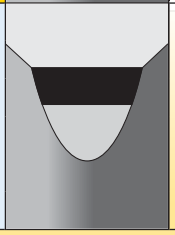












Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

			K									
			N									
			S					■	■	■	■	
			H									
KD1400		A PCD-tip brazed to a carbide carrier for high-speed machining of non-ferrous materials. KD1400 has excellent chipping resistance with good wear characteristics. Coolant is preferred.	P									
			M									
			K									
			N	■	■	■						
			S									
			H									
KD1410		A PCD-tip brazed to carbide for machining aluminium with a very high silicon content, abrasive non-ferrous materials, and fibre-reinforced plastics. KD1410 can be used at very high cutting speeds, even where good surface finishes are required. This grade can be used both wet or dry but is suggested to use coolant where good surface finishes are required.	P

Grades

Coating	Grade Description	wear resistance ← → toughness	05	10	15	20	25	30	35	40	45
KD1415	PCD-tip brazed to carbide for general machining of aluminium with a low silicon content, non-ferrous heavy metals, and plastics. KD1415™ can be used at high cutting speeds and for continuous cutting, even where outstanding surface finishes are required. KD1415 is suitable for wet and dry machining.	N		■	■						
KD1425	A PCD-tipped brazed to a carbide carrier for high-speed machining of aluminium and other non-ferrous materials. KD1425™ provides superior wear resistance with moderate toughness to resist chipping. Coolant is preferred.	N	■	■	■						
KTPK20	Cermet with PVD-TiAlN/AlCrN multi-layer coating. This tough cermet is primarily used in light and general machining of steel, stainless steels, and cast irons. Performs best dry.	P M K			■ ■ ■	■ ■ ■	■ ■				
KY3500	A ceramic cutting material based on micro-grain Si_3N_4 primarily for use in light to general machining of grey cast iron and ferritic ductile cast iron. Dry machining is preferred while using this grade.	K				■	■	■	■		
KYS30	KYS30™ is the latest in the line of α/βSiAlON grades for general purpose to finish machining of high-temperature alloys. This grade provides excellent wear characteristics, with better toughness and thermal shock resistance than whisker ceramics. KYS30 also gives improved thermal stability.	S				■	■	■			
KYSP30	Combines excellent wear properties, fracture toughness, and thermal shock resistance for general purpose to finish machining of high-temperature alloys. KYSP30 provides superior depth-of-cut notch resistance compared to whisker ceramics.	S					■	■	■		
MP91M	CVD-coated carbide grade with TiN/MT-TiCN/Al_2O_3. Tough substrate in combination with wear resistant for roughing and semi-finishing of steel, cast iron, and hardened materials.	P K H				■ ■	■ ■ ■	■ ■ ■	■ ■ ■		

Coatings provide high-speed capability and are engineered for finishing to heavy roughing.

wear resistance ⟷ toughness

Grades

Coating	Grade Description		05	10	15	20	25	30	35	40	45
SC3025	Coated carbide grade with CVD multilayer coating (TiN/TiCN/Al_2O_3). SC3025 is a wear-resistant grade with balanced toughness for general milling of cast irons at higher speeds. Best results when using dry, but can also be used wet.	K									
SC6525	Coated carbide grade with CVD multi-layer (TiN/TiCN/Al_2O_3). Tough substrate with good speed capability. SC6525 has a wide application area in general and roughing milling of steels, stainless steels, and cast irons. Performs best dry, but can also be used wet.	P, M, K									
SP4019	Fine-grained substrate coated with PVD TiAlN nano-composite. First choice for applications with thin to medium chip thickness. This grade works on many workpiece materials, dry and wet.	M, K, N, S, H									
SP6519	Coated carbide grade with PVD TiAlN nano-composite coating on a tough substrate. Primarily for use in general and heavy machining, dry and wet.	P, M, K, N, S, H									
X400	Coated carbide grade with thick PVD TiAlN nanocomposite on X-Grade™ technology substrate. With excellent toughness, good choice for difficult cutting conditions on alloyed and hardened steels. Usable in combination with high feeds.	P, H									
X500	CVD TiN/TiCN/TiN coated carbide on tough substrate (X-Grade™ technology). For difficult applications with heavy impacts, vibrations, or unstable conditions. High stability against thermal cracks. Excellent grade for high-temperature alloys, stainless steels, and titanium.	P, M, S									
X700	PVD TiAlN nano-coating on premium substrate (X-Grade™ technology). Milling of stainless steel, super alloys, and titanium with medium applications.	M, S

Dodeka™ Series

Leader in Advanced Face Milling Applications

Primary Application

Dodeka Mini, Dodeka, and Dodeka MAX™ platforms are the most comprehensive face milling boosters on the market today. Twelve true cutting edges per insert mean low cost-per-edge and high productivity. With Beyond™ premium milling grades, achieve up to 30% higher metal removal rates (MRR), 25% lower cutting forces due to soft cutting action, and up to 35% better tool life in light to heavy machining.

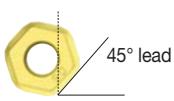
Features and Benefits

Dodeka Series • Most comprehensive face milling platform on the market. Providing an excellent cost-per-cutting edge with market leading performance. The Dodeka Series platform will cover all your face milling application needs.

All cutter body variations can be loaded with one insert style.

Dodeka Mini High-Feed 15°
Dodeka High-Feed 15°

12 True Cutting Edges

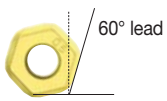


Dodeka Mini **Ap1 max = 1,6mm**
Dodeka **Ap1 max = 2,2mm**

Dodeka Mini HF and Dodeka HF can be loaded with all Dodeka Mini standard inserts, except wiper inserts.

Dodeka Mini 45°
Dodeka 45°
Dodeka MAX 45°

12 True Cutting Edges



Dodeka Mini **Ap1 max = 3,2mm**
Dodeka **Ap1 max = 4,5mm**
Dodeka MAX **Ap1 max = 8,0mm**

Best-in-class leader in face milling up to Ap1 max = 8mm.

Dodeka Mini 60°

12 True Cutting Edges

Dodeka Mini **Ap1 max = 4,4mm**

Achieve a higher axial depth-of-cut capability up to Ap1 = 4,4mm with standard Dodeka Mini inserts.

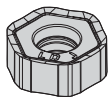
Dodeka Mini High-Feed

First choice for long reach face milling applications or light fixtures.

Chip thinning effect due to lead angle 14,5°. Tremendous enlargement of feed rate and metal removal rate (MRR).



Up to 40% shorter machining cycle time versus conventional milling.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Twelve cutting edges per insert.
- Higher Ap1 max with standard inserts.
- Productivity booster in all materials.

Please see pages X22–X37 for recommended starting speeds.

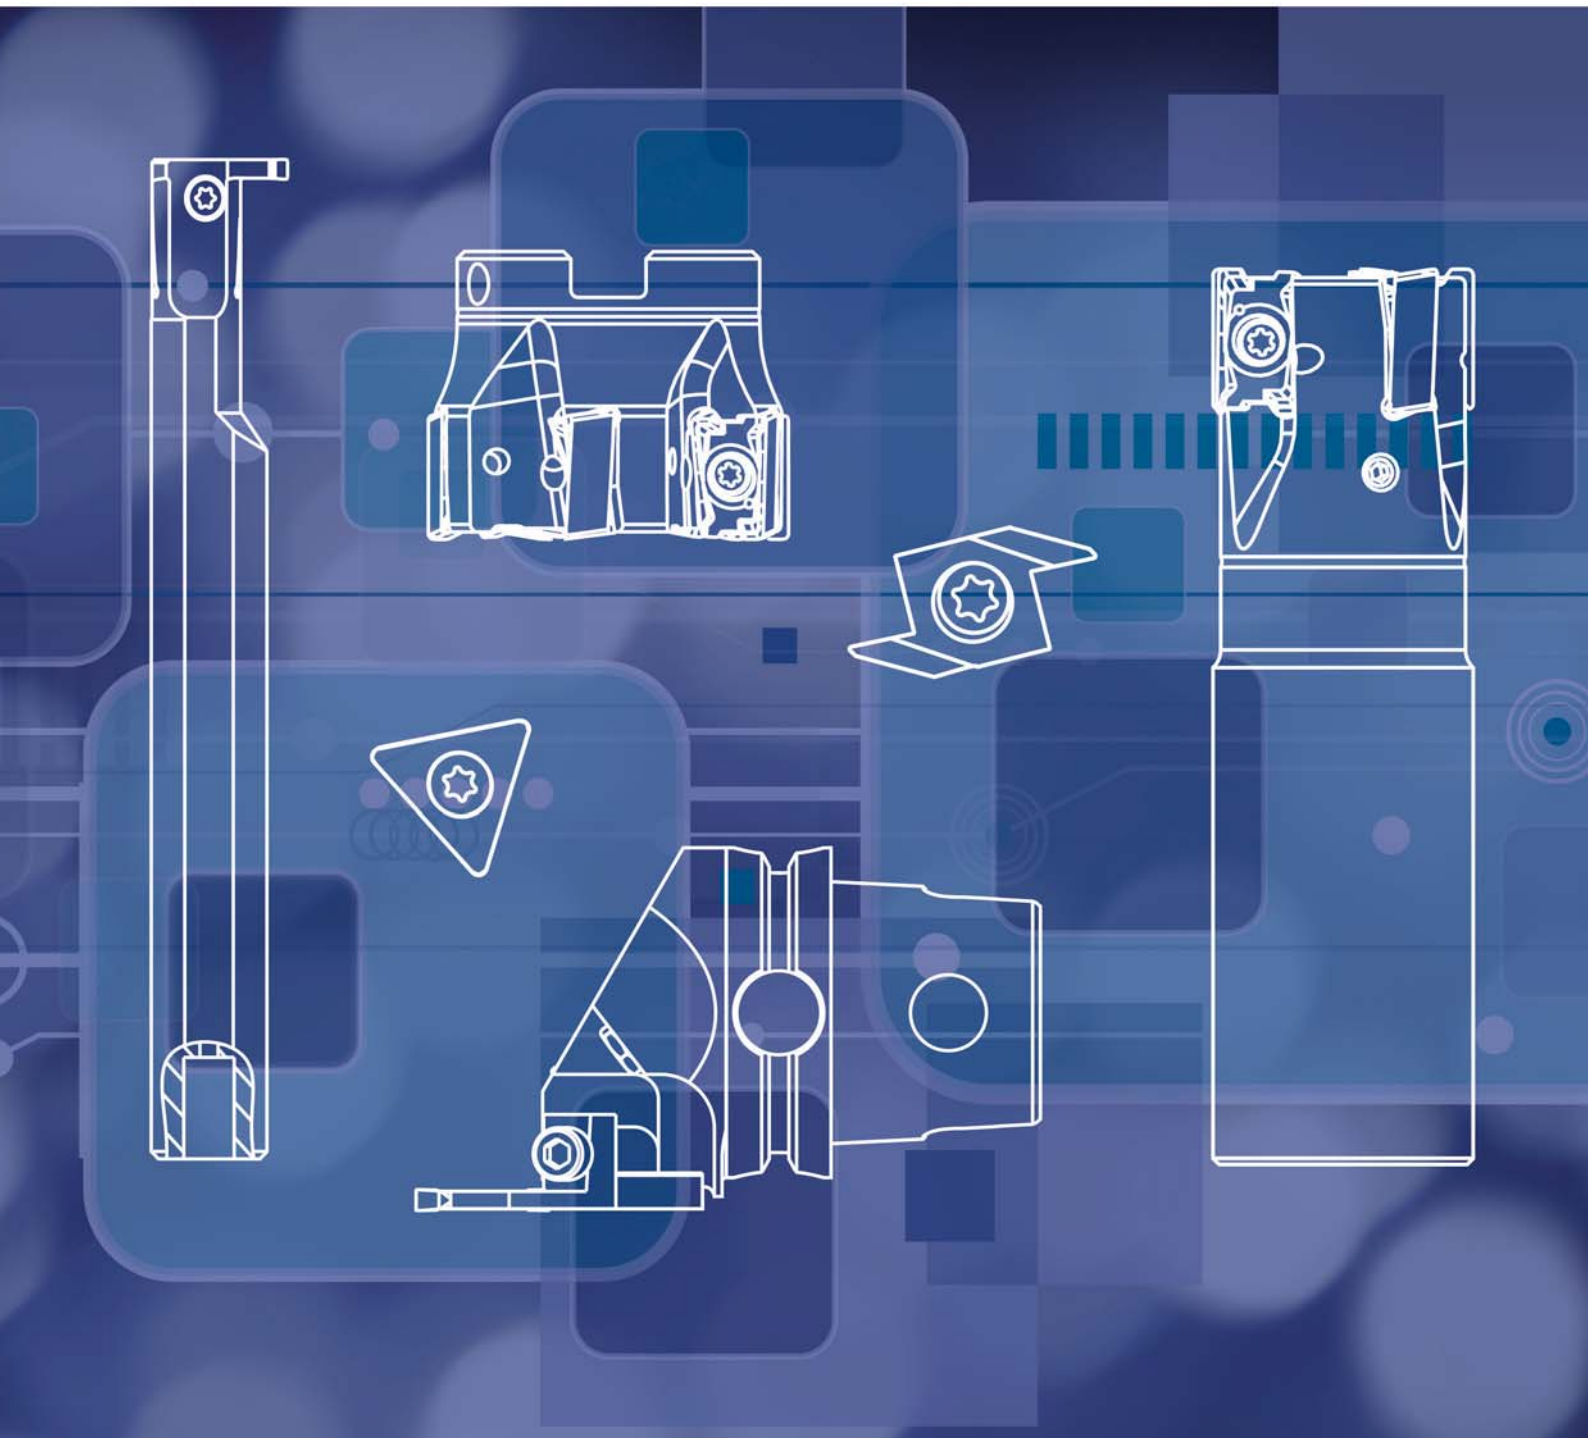
NOVO KNOWS
ART TO PART TO PROFIT



Being as productive and profitable as possible is your fundamental goal. With the addition of NOVO™ applications to your team, your goal can be achieved. NOVO applications possess powerful digital tools that link together process planning, inventory availability and purchase, cost-per-part management, and productivity improvements.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximises every shift.

NOVO™

Mill 16™

Face Mills for Cast Iron Machining.

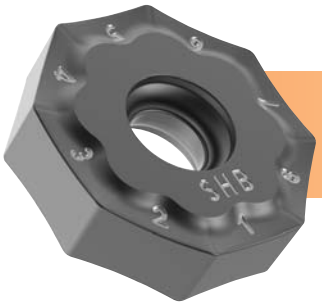
Screw-On Clamping

Wedge Clamping

Features

- 16 effective cutting edges per insert.
- Ap1 max = 5,5mm.
- Coarse, medium and fine pitch cutters.
- Cutter bodies with pocket seat numbering system.
- Cutter diameter range = 50–250mm.
- High-precision periphery ground inserts.
- Inserts with cutting edge numbering system.
- Lower cutting forces.
- Clearance on second main cutting edge.

Benefits

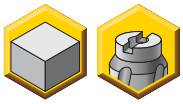


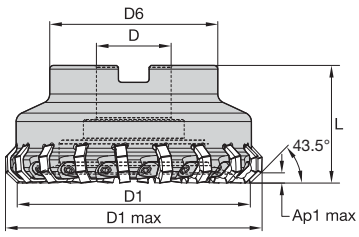
- Low cost per edge to cut cost per part (CPP).
- Perfect fit for most cast iron face milling requirements.
- High feed rates to boost productivity and reduce cycle time.
- Comprehensive standard offering to address most needs of the shop floor.
- Improved axial runout and tool life.
- Very smooth cutting action and lower cutting forces.
- Orientated edge positioning to support axial and radial runout.
- Reliable cutting above Ap1 = 5,5mm addresses castings with varying skin thickness.

Primary Application

The new Mill 16™ series is a specially-made platform for rough milling of components like engine heads and blocks, housings and gear boxes in cast iron materials (CGI, DCI, GCI), and all other cast iron face milling jobs. Best-in-class for machining CGI materials.

Split Case Design





Innovative insert design to reduce cutting forces and increase productivity at lower cost per edge.

- Semi-finishing and light machining
- Medium roughing
- Heavy roughing

- Productivity booster for machining cast iron materials.
- Insert with 16 cutting edges.

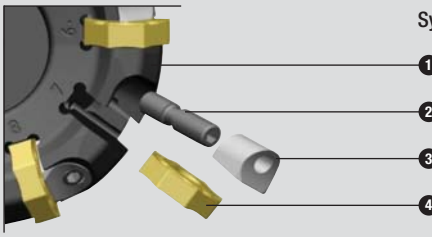
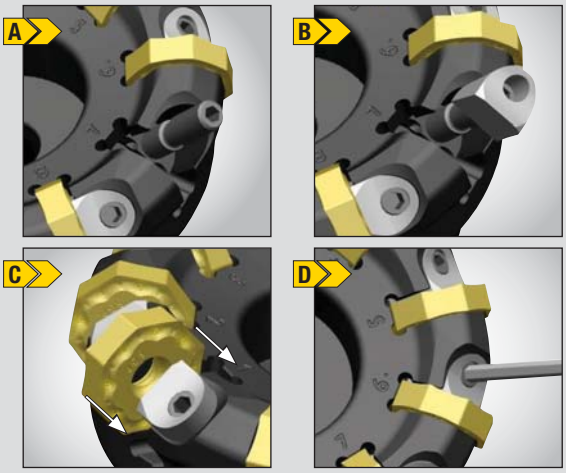
NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

User Information

- Only use with indexable inserts ONPX0806**/ONGX0806** (ONPX64**/ONGX64**).
- Only use original Kennametal spare parts as per the current catalogue.



- Maintenance and repair of cutters should only be carried out by Kennametal.
- The tools must only be used in combination with suitable tool adaptors and machine spindles.
- Use only the recommended torque settings when assembling the cutters for use. For further information contact the KMT CAS Team.



* These assembly instructions relate only to the Kennametal Mill 16 Face Mill family and not to its connection to a spindle or spindle adaptor.

Preparation

- Prior to use, ensure the cutter is thoroughly cleaned and remove all dirt, grease, and anti-corrosive protection.
- Carefully grease the differential screws with copper grease. Ensure the rest of the cutter is clean.
- When loading the inserts into the cutter, please ensure that they are inserted in the clean pocket seat in the correct position.
- Mounting position: The flat side of the clamping wedge sits on top of the insert face. We recommend to mount the inserts by following the insert's edge numbering system for orientated insert seating. Active cutting edges shall all have the same cutting edge number.

Insert Clamping and Adjusting

Pre-setting of Inserts

A. Screw the differential screw (2) into the cutter body (1) by approximately 2 turns using a 3mm hex wrench.

B. Place wedge (3) on differential screw (2) and fasten into the cutter body.

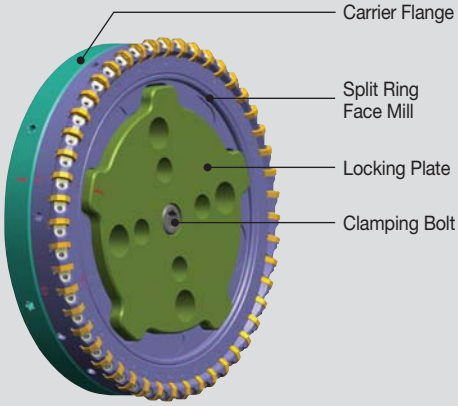
C. Push insert (4) into the pocket seat by hand in the direction shown.

D. Clamp insert (4) with wedge (3) by rotating the differential screw with a clamping force of MA = 2 Nm (18 in/lbs). The differential screw must not stick out of wedge.

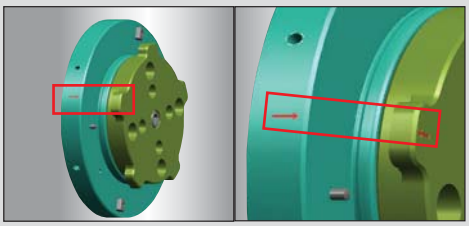
E. Repeat steps A–D for all inserts.

Tightening the Inserts

F. Tighten all inserts of the pockets with the wedge using the differential screw with a clamping torque of MA = 7 Nm (62 in/lbs).



Split Cutter Assembly Instructions

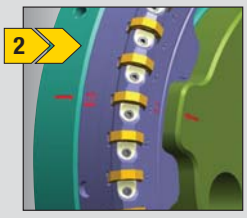


Please read and follow the instructions below for safe and productive application.

User Information

These assembly instructions relate only to Kennametal split-case milling cutters and not to its connection to a spindle or spindle adaptor.

System Components



Initial position must be in such a way that the arrows in the carrier flange and locking plate coincide with each other.

Place the split ring face mill over the carrier flange in such a way that arrows in the locking plate and carrier flange coincide with the marking "A" in the cutter.

Turn the cutter ring clockwise from marking "A" to marking "B".

Tighten the clamping bolt with a torque of 100 Nm.

Extended Kennametal Service

Adjustable Torque Wrenches

When working with inserts, it is especially important to use the correct torque. Kennametal offers extended service levels by assuring best tightening with adjustable torque wrenches. Please order separately as needed.

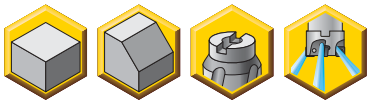
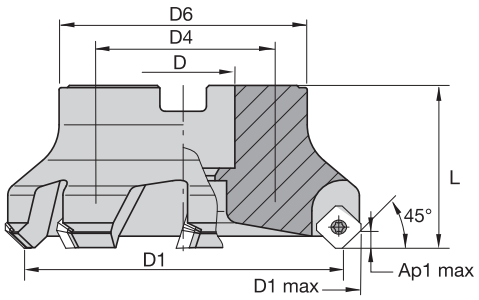
KSSM™ 45°



Universal face mill for conventional machining.



Features and Benefits

- Insert SE.T1404.
- Ap1 max = 6,6mm.
- Four true cutting edges.
- Pocket seat protection with carbide shims.
- Easy handling and rapid insert change.

- Rapid insert changes.
- Carbide shims for pocket protection.

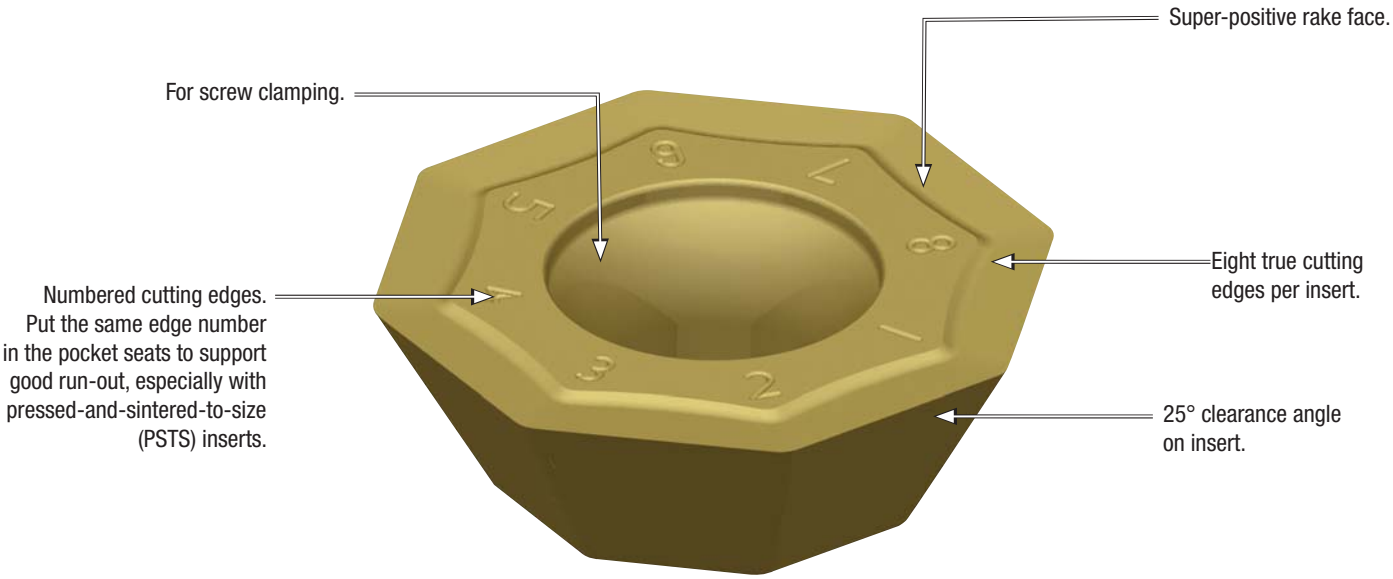
NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

KSOM™ Mini · KSOM Milling Tools

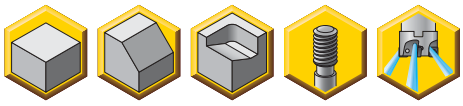


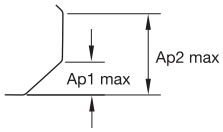
Primary Application

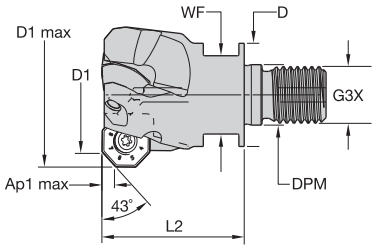
High-positive face mills with eight cutting edges for use in most workpieces materials. Due to its design, face milling, plunging, helical interpolation, and ramping are possible with KSOM mills.

Features and Benefits

- Super-positive rake face for soft cutting action.
- Low cutting forces deliver higher feed capability.
- 25° clearance angle on insert allows excellent free cutting.
- Excellent performance in stainless steel and super alloys.
- First choice solution for machining turbocharger materials like 1.4826, 1.4838, 1.4848, and 1.4849.







KSOM Mini: insert OF*T06
— Ap1 max = 3,5mm (8 indexes)
— Ap2 max = 9mm (4 indexes)

KSOM insert OF*T07
— Ap1 max = 5mm (8 indexes)
— Ap2 max = 11mm (4 indexes)

- Eight cutting edges per insert.
- Super soft cutting.

Ap1 max = 3,5mm (8 edges)
Ap2 max = 9mm (4 edges); reduce feed rate by 40%

Kennametal Tools for **Railways** and **Wheel Machining**

Kennametal offers a complete line of tooling for wheel and axle maintenance in railroad shops. All tools incorporate the latest technology for maximum metal removal and higher productivity. They are proven performers in actual use over extended periods of time, under a wide range of operating conditions. Standard off-the-shelf inserts and fewer pieces of hardware reduce inventory and operating costs. Included in this range are tools for reconditioning mounted wheel sets, wheel boring, wheel truing, axle turning, and journal burnishing.

Visit **kennametal.com** or contact your local Authorised Kennametal Distributor.

KENNAMETAL®

KSSM8+™ Face Milling Platform

Primary Application

The KSSM8+ platform is a first-choice face milling platform for **versatility** and a **reduced cost per edge**. This platform just got better with the latest pressing technology from Kennametal, which delivers pressed and sintered-to-size (PSTS) inserts ideal for general machining in **cast iron and steel**. With our latest KCPM40™ grade offering, PSTS inserts deliver exceptional performance. Now more than ever, the KSSM8+ platform is the economical solution for applications requiring a **near-90° shoulder**.

Features and Benefits

Features

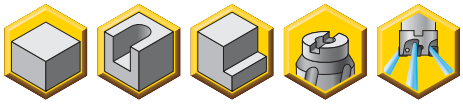
- Double-sided insert with 8 cutting edges.
- Face mill with close to a 90° shoulder.
  - IC 10 (88° lead)
  - IC 12,7 (87° lead)
- Medium and fine density cutters.
- -LD and -GD geometry inserts.

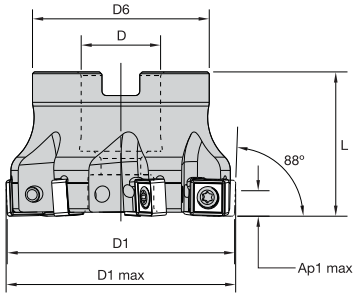
Benefits

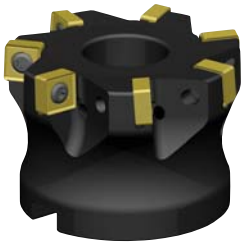
- Maximised number of cutting edges.
- Lower cost-per-edge.
- Reduced power consumption.
- Reduced deformation/chatter.
- Exceptional surface finish.
- Stronger edge for roughing.

Versatile Platform with Multiple Insert Options and Grades

Cost per Edge
Double-sided square inserts,
8 cutting edges.







Optimised Cutting Forces
4° axial and 10° radial rake
angles reduce power consumption.

Through Tool Coolant/Air
Directed to the cutting edge
for optimum cooling.

- Eight cutting edges offer a lower cost per edge.
- Soft cutting action with low cutting forces.

Solution Capabilities

RAIL MILLING

Kennametal customers benefit from the highest service levels, our long-term experience, and application knowledge in the rail milling industry.

- Solutions for all applications in rail and wheel machining.
- Technical support to find the right tools for the application and to learn how to use them the best way.
- Highly productive tooling solutions, including indexable inserts up to eight cutting edges.
- High-performance tools with helix-like partitions and long tool life.
- Solutions available to optimise vibration, performance, and cutting action, depending on the application.

Experience the advantages at your Authorised Kennametal Distributor or at **kennametal.com**.

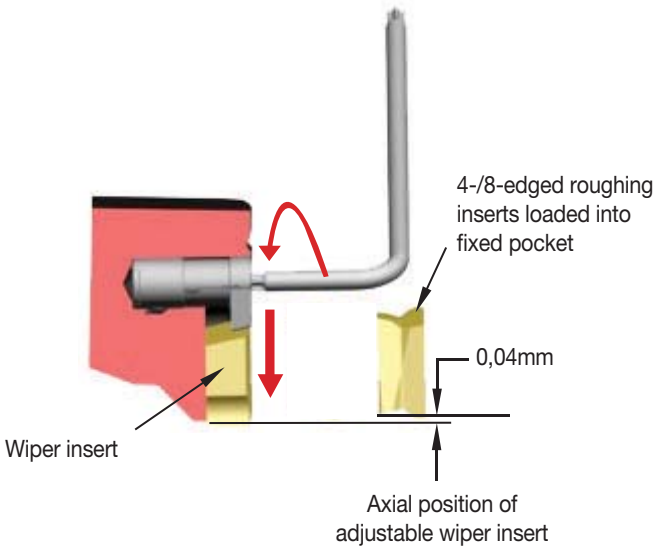
KENNAMETAL®

kennametal.com

Fix-Perfect™ Cast Iron Rougher and Finisher

Primary Application

Performance booster in machining cast iron materials. Based on workpiece requirements, Fix-Perfect roughers and finishers cover all face and shoulder milling applications when machining cast iron materials with best-in-class productivity. Eight true cutting edges per insert deliver low cost per edge and best cost per part (CPP) ceramic inserts available as standard line items.



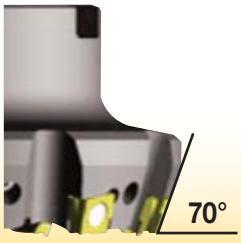
Features and Benefits

Fix-Perfect Cast Iron 70° and 90° Roughing and Finishing in One Tool

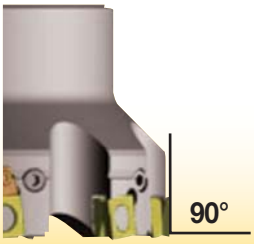
- Innovative tangential insert clamping.
- First choice for high feed rates.
- Protection of non-cutting edges.
- Adjustable element for fine finishing with wiper inserts.
- PCBN-tipped wiper inserts available for excellent floor finish.
- Micro-precise runout setup.

Fix-Perfect Cast Iron Finisher Best-in-Class Fine-Finishing Concept

- Rigid and stable cutter design.
- High-precision pocket seat.
- Perfect axial runout without insert adjustment.
- Reliable, excellent floor finish and flatness.
- Easy handling and low-cost cutter setup.

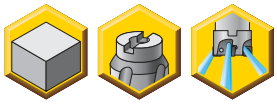


Fix-Perfect™ Finisher

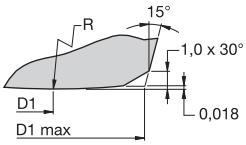


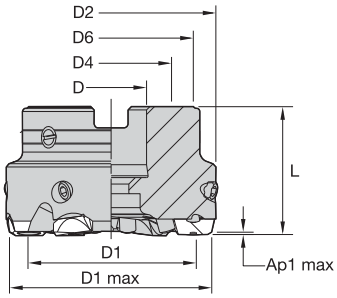
Fix-Perfect Cast Iron

Fix-Perfect Cast Iron 70° and 90°



Fix-Perfect 70°





Fix-Perfect 90°

- Perfect axial runout without insert adjustment.
- Excellent floor finish and flatness.
- Easy handling and cutter setup

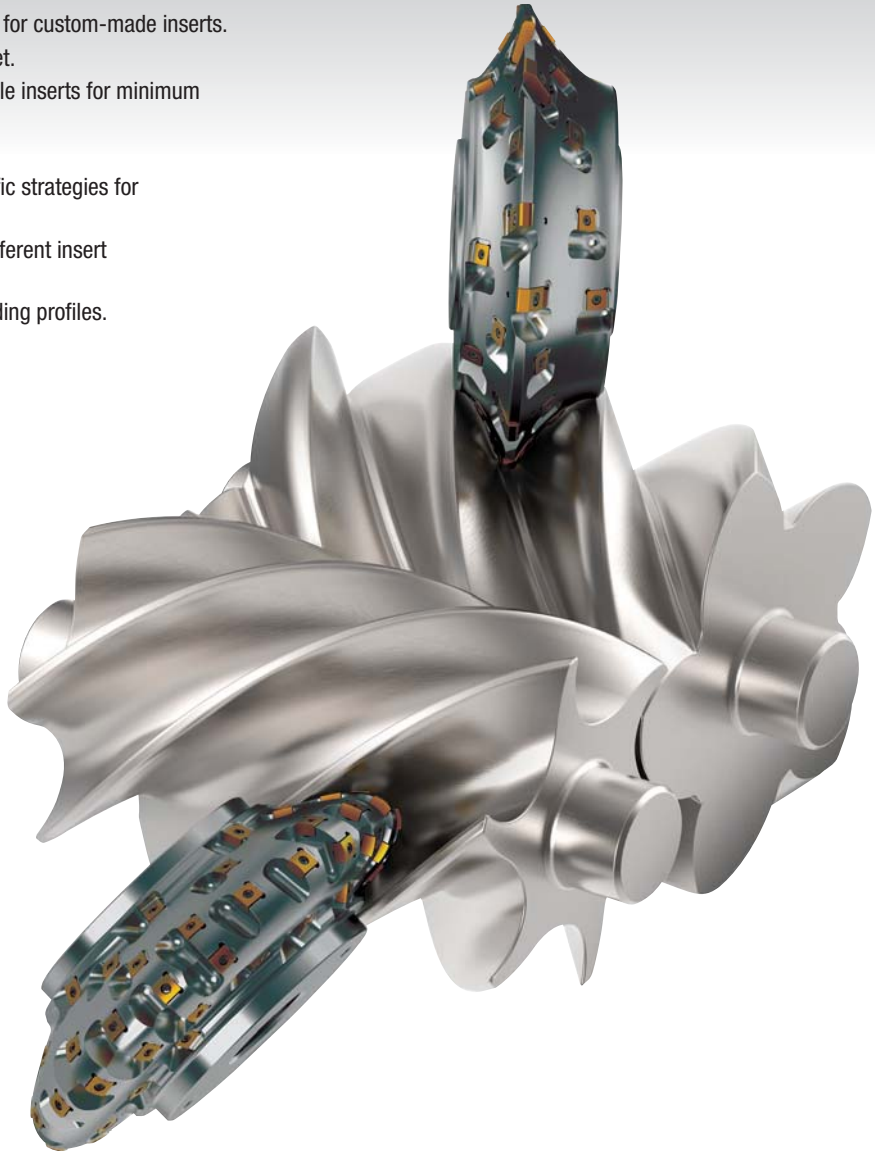
NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Insert Loading Procedure

1. Clean insert and insert pocket seat.
2. Load insert — push insert against pin and axial pocket wall.
3. Tighten screw to a torque of 5 Nm.
4. Check the axial runout.
5. Do not exceed the maximum recommended RPM.



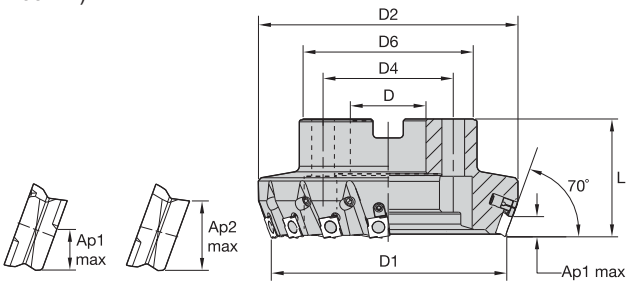
tool diameter (mm)	maximum axial runout	maximum RPM
63	10 µm	20000
80	10 µm	15900
100	10 µm	12750
125	10 µm	10200
160	15 µm	7950
200	15 µm	6350
250	15 µm	5100

Solution Capabilities

SCREW-ROTOR MILLING

Kennametal customers benefit from the highest service levels, our long-term experience, and application knowledge in milling of screw-rotors.

- Faster availability due to standardised processes for custom-made inserts.
- Solutions for all machines currently on the market.
- Very close contour profile with standardised profile inserts for minimum grinding allowance.
- Tools can be used in many different materials.
- Increased productivity through application-specific strategies for optimised milling.
- Smooth cutting action due to multiple rows of different insert alignments for optimum performance.
- Innovative solutions for small rotors with demanding profiles.

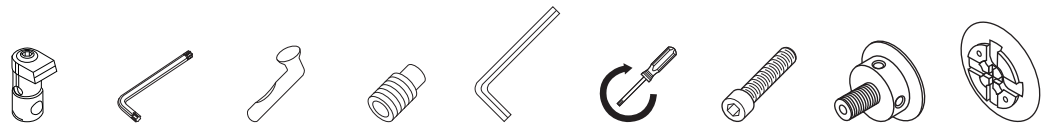


Experience the advantages at your Authorised Kennametal Distributor or at **kennametal.com**.

KENNAMETAL®

kennametal.com

- Eight cutting edges per insert.
- Rough and finish in one operation.
- Tangential mounted inserts deliver higher feed rates.
- Adjustable pockets (D1 = 80–160mm).



Ap1 max = 5,9mm (8 edges)
Ap2 max = 9,5mm (4 edges), reduce feed rate by 30%

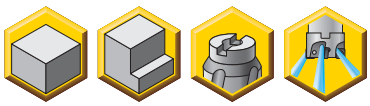
Productivity and Innovation — Powerful Gear Cutting Tools with Optimised Design

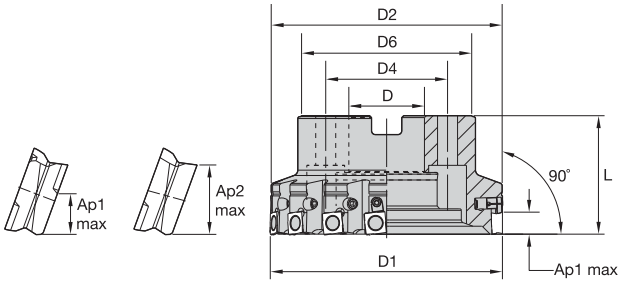
Gear Milling

Production requirements for large gears emphasise cost control with improved productivity. Our solutions feature higher cutting speeds, higher feed rates with lower power consumption, and increased productivity by using indexable inserts with up to eight cutting edges.

FEATURES AND BENEFITS

- Optimised cutting division, along with the use of positive cutting insert geometries, ensure low power requirements at higher feed rates.
- Tool wear is minimised by optimising the indexable insert number to achieve smoother cuts and increased productivity.
- Higher cutting speeds achieved through innovative and material-specific tailored cutting materials and geometries.
- Lower tooling costs due to indexable inserts with up to eight cutting edges.
- Easy insert changes made possible by better accessibility.



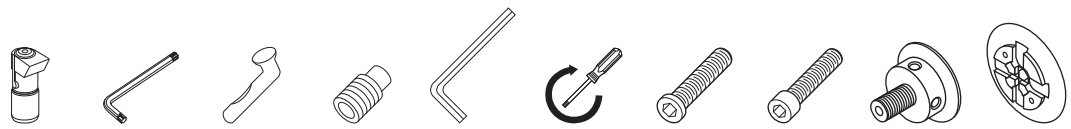


Experience the advantages at your Authorised Kennametal Distributor or at **kennametal.com.**

KENNAMETAL®

kennametal.com

- Eight cutting edges per insert.
- Rough and finish in one operation.
- Tangential mounted inserts enable higher feed rates.
- Adjustable pockets (D1 = 80–200mm).



Ap1 max = 6mm (8 edges)
Ap2 max = 10mm (4 edges); reduce feed rate by 30%

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Rough and finish in one operation.
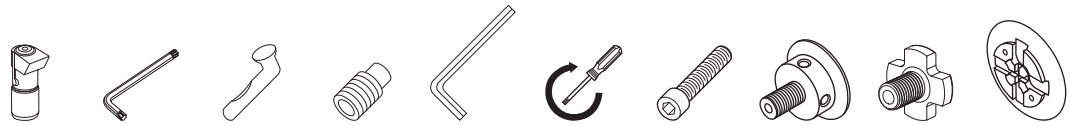
- Tangential mounted inserts enable higher feed rates.
- Adjustable pockets (D1 = 80–250mm).
- Eight cutting edges per insert.



Ap1 max = 8mm (8 edges)
Ap2 max = 12mm (4 edges); reduce feed rate by 30%

Introduction to Fitting Cutting Bodies

procedures:	roughing		roughing/finishing	
	 fixed pocket	 adjustable pocket	 fixed pocket	 adjustable pocket
1 Reset adjusting element T x T9	–		–	
2 Insert roughing insert Tighten SW 3 M_{An} = 5 Nm				–
3 Tighten adjusting element gently	–		–	–
4 Insert finishing insert and pre-tighten SW 3 M_{VG} = 1 Nm	–	–	–	
5 The finishing insert is positioned 0,04mm in front of the highest roughing insert	–	–	–	
6 Tighten the finishing insert M_{An} = 5 Nm	–	–	–	

NOTE: This process must be repeated whenever an indexable insert is changed. The ball is loose.

Changing the adjusting element
1. Remove the taper screw①.
2. Loosen the SW 1,5 screw②.
3. Remove the adjusting element.

ATTENTION: The maximum permissible cutting speed of the milling cutter heads is vc max = 1000 m/min. Only use original parts when clamping the indexable inserts.

Next Generation of HexaCut™

Milling Inserts Are Now Available for Roughing and Semi-Finishing of Cast Iron Materials

Primary Application

The Kennametal HexaCut face milling programme is specifically engineered for rough and semi-finish face milling of cast, ductile, and compacted graphite iron. Twelve cutting edges drastically reduce your cost per edge and increase tool life. Shorter setup times and excellent cutter accuracy allow you to apply the HexaCut programme to the most demanding jobs. One ceramic and eight carbide grades with six insert geometries deliver high feed rates and will enable you to reach optimum horsepower.

Features and Benefits

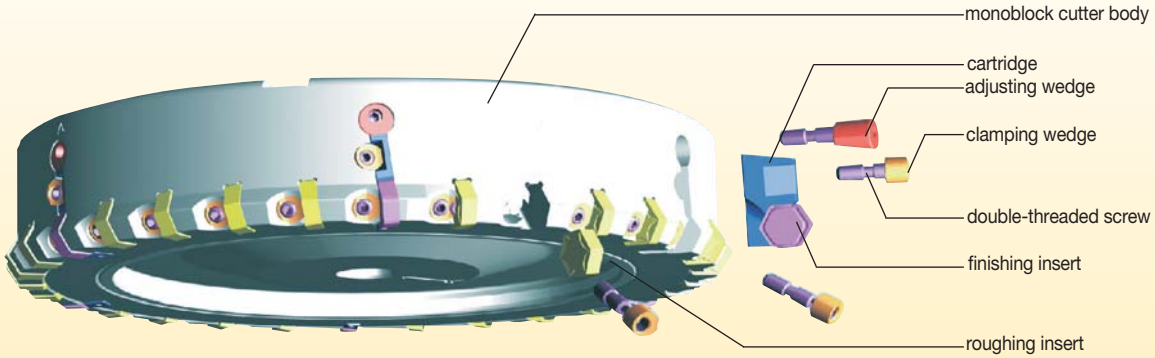
- New insert topographies for existing HexaCut platform with latest cutting edge design.
- Specifically engineered for rough and semi-finish face milling of cast, ductile, and compacted graphite iron.
- Up to 20% better tool life and 10% less power consumption.
- High precision ground on insert IC to achieve a better axial and radial runout.
- First HexaCut roughing insert with integrated wiper facet for better floor finish.

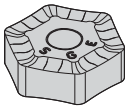
New Standard Insert Offering for HexaCut™ Series

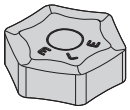
Roughing and semi-finishing of automotive engine blocks and other cast iron face milling operations.

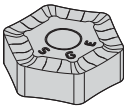
HNHX0905..ENLE
New geometry for semi-finishing and light roughing operations.

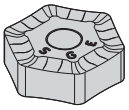
HNHX0905ANSNGE
New geometry for roughing; integrated wiper facet for advanced floor finish.

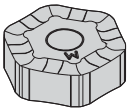


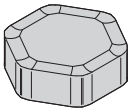












HNHX0905..SNGE
New geometry with improved rake and edge prep design for roughing operations.

HNPX0905..SNGE
New stable geometry for heavy roughing in severe machining conditions.

Please see pages X22–X37 for recommended starting speeds.

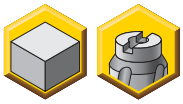
Adjustment Instructions

Before Being Used for the First Time

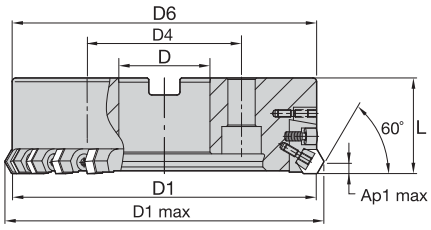
- The milling cutter must be carefully cleaned of anti-corrosive materials, dust, etc.
- The milling cutter should only be washed when all components have been dismantled.
- Only the double-threaded screws of the clamping or adjusting wedge should be lubricated with copper grease; all other components must have clean metallic surfaces.
- A torque wrench is recommended to tighten the double-threaded screws.
- When fitting indexable inserts on the milling cutter, ensure that they are inserted in the correct position in a clean insert seat and that they are held in position during clamping.

For 45° Roughing Mills without Anvils

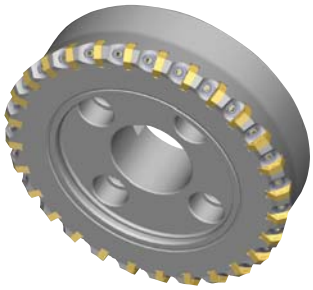
- The double-threaded screws on the clamping wedges for the indexable inserts are first pre-tightened to approximately 2 Nm and then tightened to a final torque of 7 Nm.



ATTENTION



At each tool adjustment the body, indexable inserts, and spare parts must be checked and replaced, if necessary. Before each tool use the double-threaded screws of the indexable inserts and the stops must be tightened in the specified order to a torque of 7 Nm. In addition, even if the cartridges have not been adjusted, the double-threaded screws of the adjusting wedges must be checked to see if these have been tightened to a torque of 3 Nm. If not, they must be re-tightened to this torque.



NOTE: The tools must only be used in accordance with their function. We accept no liability for their improper use. Changes of any kind and/or printing errors are not valid grounds for claims.

- Monoblock cutter design.
- High feed rates.
- CGI milling solution.
- Twelve cutting edges per insert.

Face Milling

Insert setting procedure

This procedure is to be used on all 60° lead roughing/finishing mills using the unmarked roughing cartridge, the finishing cartridge (marked •) and the corrected edge cartridge (marked ▬). These steps must be followed when adjusting the cutters for finishing inserts.

1. Clean all insert pockets.
2. Mount all wedges and cartridges. Torque the cartridge lock wedge screw to 3 Nm.
3. Mount all inserts, making sure they are seated properly in the pocket, and torque the insert lock wedge screws to 3 Nm.
4. Torque the wedge screws for all fixed pocket inserts to 7 Nm.
5. Loosen the cartridge insert wedge screw and the cartridge lock wedge screw.
6. Pressing the insert into the cartridge pocket, adjust the cartridge to 0,20–0,30mm below the fixed pocket inserts.
7. Torque the insert lock wedge screw and the cartridge lock wedge screw to 3 Nm.
8. Adjust the axial position to 0,03–0,04mm above the fixed pocket inserts.
9. Loosen the cartridge insert lock wedge screws and then re-torque to 3 Nm.
10. Adjust the axial position to the final dimension, 0,04–0,05mm above the highest fixed pocket insert.
11. Torque the insert lock wedge screws and the cartridge lock wedge screws to 7 Nm.
12. Conduct a final check of the axial runout and position.

The KSSR™ 84° Inserts

Primary Application

The Kennametal new line of KSSR 84º inserts are versatile, easy-to-use, and right- or *left-hand neutral, making them ideal for automotive machining operations or any other industry that relies on transfer line manufacturing. Available in carbide and ceramic grades for applications in cast and ductile irons and alloy steels, choose KSSR 84º inserts for all fine and coarse pitch styles.

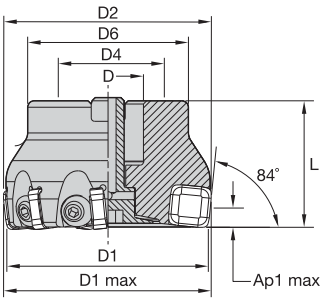
*Left-hand cutters are available as non-stock standard.

Features and Benefits

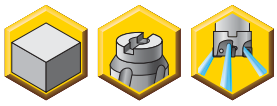
KSSR 84° Features

- Available in metric and inch products, diameters from 63–200mm.
- Fine and coarse pitch styles.
- Easy-to-use and to adjust with shorter setup time.
- New wiper inserts in carbide and ceramic will provide excellent surface quality.

Improved Versatility



- Proven solution for the automotive segment.
- Right- and *left-hand cutters, ideal for transfer lines.
- Premium grades in carbide and ceramic for applications in cast and ductile irons and alloy steels.
- Inserts are neutral and can be used for right- or left-hand cutting.



Unrivaled Benefits

- Capability: 5mm maximum depth of cut.
- Excellent accuracy:
  Radial = +/- 0,025mm
  Axial = adjustable +/- 0,002mm
- Inserts have eight true cutting edges.

- Eight cutting edges per insert.
- Fast and easy insert indexing.
- Highest feed rates.
- CGI specialist.

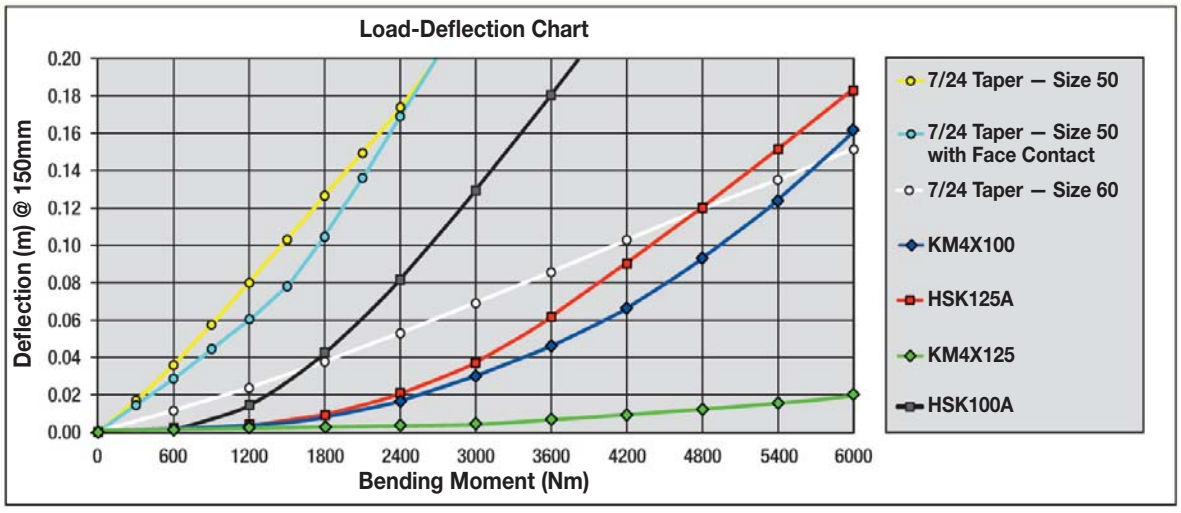
NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.



KM4X™

The Latest Innovation in Spindle Interface Technology!

Dramatically increase your metal removal rates when machining high-temperature alloys!

- Run jobs at significantly faster feeds and speeds than what is achievable with other spindle interfaces.
- Unique use of clamping force and interference level increases clamping capability 2 to 3 times.
- Achieve lower cost of ownership, increased throughput, and superior results.

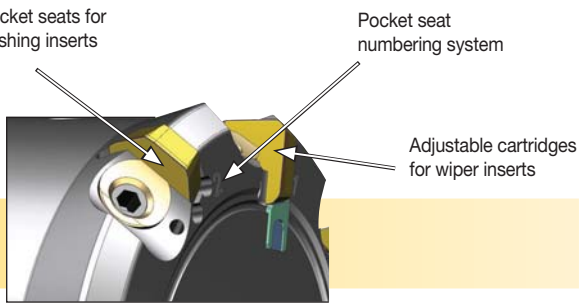
KCFM™ 45

Cast Iron Finishing Milling

KCFM 45 is the latest full-face PcBN technology for milling inserts. These inserts are available in PcBN, ceramic, and carbide grades, with a super-positive geometry available on semi-finisher and wiper style inserts.

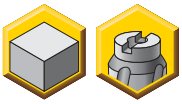


Cutter bodies feature high-precision pocket seats and a pocket seat numbering system to reduce tool setup time.

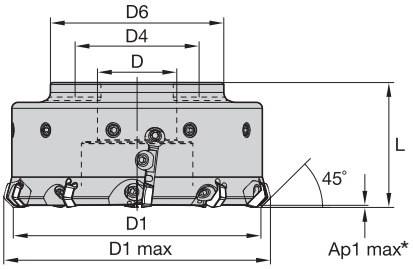
Features and Benefits

- Super-positive geometry on semi-finisher and wiper inserts.
- New PcBN milling grade KBK50 for fine-finishing cast iron.
- Fixed pocket seats for semi-finishing inserts.
- Adjustable pocket seats for wiper inserts.
- Cartridges available for semi-finishing inserts.
- Low cutting forces to manage vibrations at critical components.
- Significantly reduced machining cycle time and cost per part.
- High precision pocket seats to reduce tool setup time.
- User friendly adjustment for accurate run-out within two microns.
- Only use semi-finishing inserts for lower floor finish requirement.

First choice for easy fine finishing with low cutting forces and excellent tool life.



For lower requirement on surface floor finish, it's also an option to load all pocket seats with semi-finishing inserts.



Related cartridge KCFMCA45HD07 is available as standard line item.

Configuration of Semi-Finishing and Wiper Inserts:

Semi-Finishing Insert HDHN07 	Wiper Insert SDHN12 	Dry (D)/Wet (W) Machining
PcBN (KBK50)	PcBN (KBK50)	D
Ceramic (KY3500)	PcPN (KBK50)	D
Carbide (KC514M)	Carbide (KC514M)	D/W

- Lower cutting forces due to positive hexagon inserts.
- Available in PCBN, ceramic, and carbide grades.
- Achieve higher speeds and productivity with ceramic and PCBN grades.
- *Ap1 max = 1mm with wiper finishing cartridge for SD12 inserts.
- *Ap1 max = 3mm with semi-finishing cartridge for HD07 inserts.

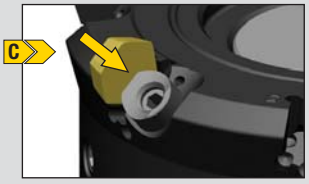
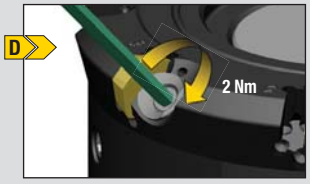
Safety Notes					
					
Read all instructions	Wear eye protection	Inspect and tighten fasteners regularly	Warning: Cutting hazard	Warning: Hot surfaces	Do not exceed Max. RPM

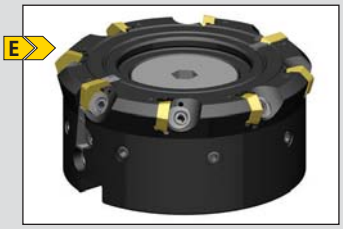
Customer Information Sheet



Hexagon Insert Installation

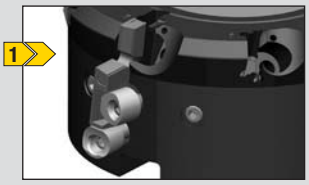


Position the differential screw in the pocket and turn it to approx. 2 to 3 turns with 3mm hex wrench.

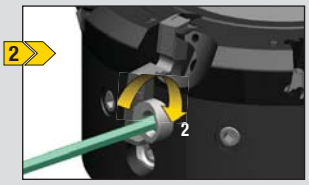


Place the wedge on the screw and fasten it into the cutter body.

Push the insert into the pocket seat by hand in the direction shown.

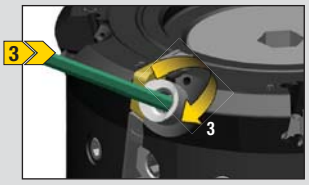


Tighten the screw with a clamping torque of 2 Nm (18 in/lbs). The differential screw must not stick out of wedge.

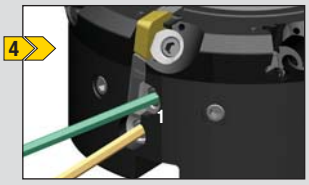


- Repeat steps A–D for all inserts. Max. axial and radial runout must be within 0.03mm (0.0012") and 0.035mm (0.0014").
- **Tighten all the differential screws with a clamping torque of 7 Nm (62 in/lbs).**

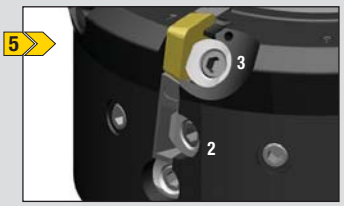
NOTE: The cutter comes preloaded with screw and wedge. Steps A and B are only required when it is necessary to change the screw and/or clamp after wear and tear or an accident. Insert changing process starts at step C in normal circumstances.



Wiper Insert Installation



Mount the cartridge in its pocket, similar to steps A and B as shown previously.



Begin tightening the screw ❷ of the cartridge locking wedge to clamp the cartridge with minimum torque.

Place the insert on the cartridge and begin tightening the screw ❸ to clamp the insert with minimum torque.

Release the height adjusting screw ❶ slightly and adjust the wiper insert's position so that it is 0.03mm (0.0012") above the highest semi-finishing insert.

- The wiper inserts should be clamped in the same way as the hexagon inserts.
- **Tighten the insert screws ❸ and cartridge screw ❷ of wiper pockets to 2 Nm (18 in/lbs) and then to 7 Nm (62 in/lbs).**
- Axial runout measured at the highest point on wiper insert should be ≤ 0.003mm.

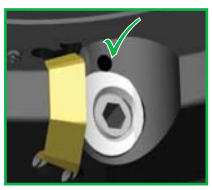
NOTE: When the cutter comes preloaded with the screw, wedge, and cartridge, skip steps 1 and 2.
To order a cartridge, use the following numbers:
#6210836 for finishing cartridge SD12.
#6210837 for semi-finishing cartridge HD07.
Number of cartridges will vary based on the diameter of the cutter.

KCFM Do's and Dont's

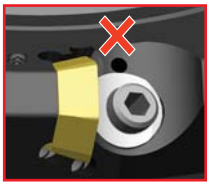
1

Ap1 ≤ 1mm (0.039")

NOTE: Ap1 max (For wiper insert SDHN12)



Ap1 > 1mm (0.039")



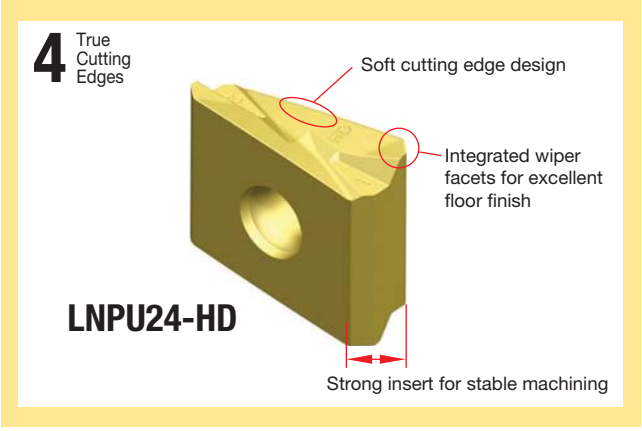
Do not exceed the depth of cut of 1mm (0.039") when the cutter is used with wiper insert.

2

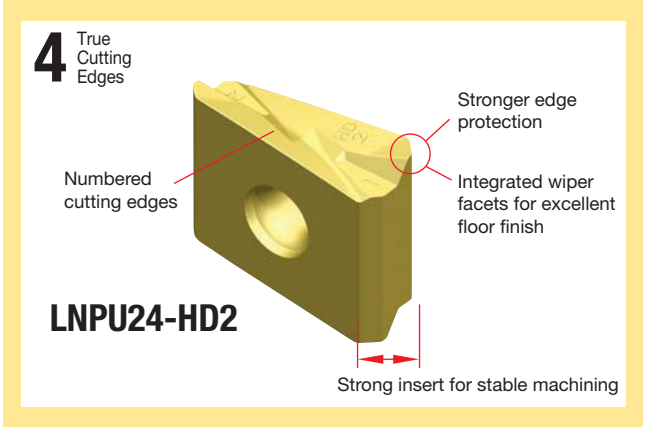
Wedge/screw projecting out of the pocket would reduce the performance.

MEGA 45°

Superior Heavy-Duty Milling

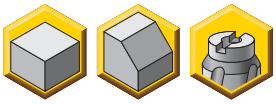


Primary Application

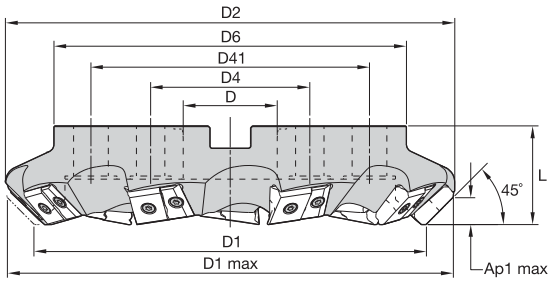


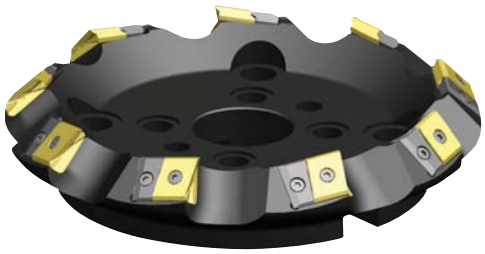
With four true cutting edges per heavy-duty MEGA 45° insert, you are getting the low cost per edge and high productivity you need and have come to expect from Kennametal. The soft cutting edge design enables 30% lower cutting forces, and the carbide shim provides protection to the cutter body. Choose MEGA 45° inserts for all steel and cast iron indexable milling needs.

Features and Benefits



Features	Benefits
• Four true cutting edges per heavy-duty MEGA 45° insert.	• Low cost per edge and high productivity.
• Soft cutting edge design.	• 30% lower cutting forces.
• Up to 30% increased Metal Removal Rates (MRR).	• Performance leader in steel and cast iron materials.
• Carbide pocket shims.	• Excellent cutter body protection.
• Cutting edge numbering system.	• Improved runout for better tool life and floor finish.
• HD2 geometry.	• Stronger edge protection to handle the toughest milling jobs, especially with scale and surfaces with varying thicknesses.





4 True Cutting Edges
Soft cutting edge design
Integrated wiper facets for excellent floor finish
LNPU24-HD
Strong insert for stable machining

4 True Cutting Edges
Stronger edge protection
Numbered cutting edges
Integrated wiper facets for excellent floor finish
LNPU24-HD2
Strong insert for stable machining

- Up to 30% higher Metal Removal Rate (MRR).
- Cutter body protection with carbide shims.

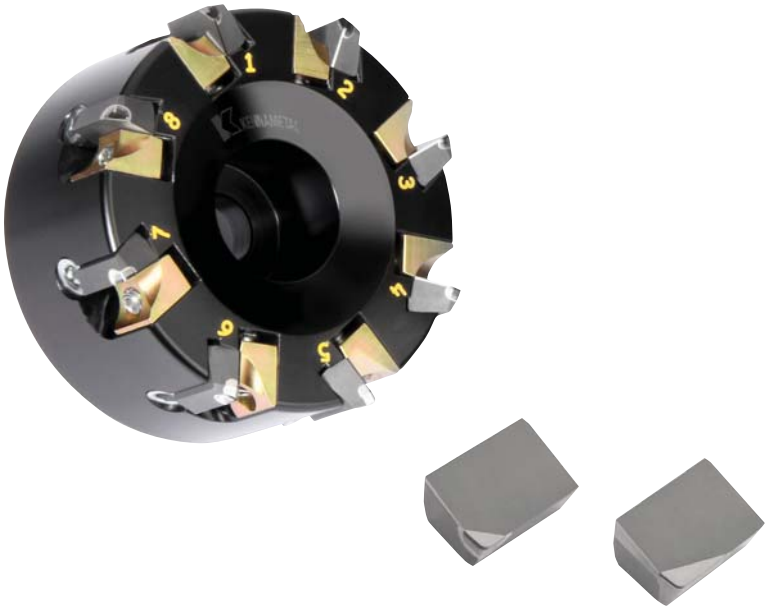
KBDM PCD Face Mills

Indexable Milling

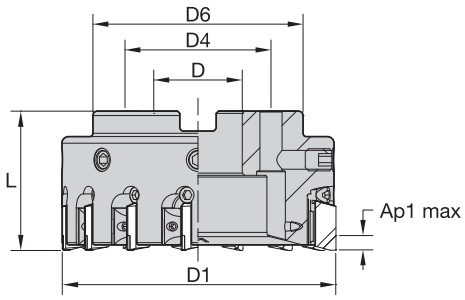
Application

The new KBDM PCD milling platform is designed and engineered for aluminum face milling applications, targeting automotive requirements.

This proven design delivers consistent performance time and time again, and has done so for 20+ years. KBDM's new look, black anodized aluminum with yellow wedges, gives it a unique appearance. However, it's what is behind the cover that really matters. Performance is key, and KBDM does not disappoint.



Features and Benefits



- Cutter bodies manufactured from hard anodised aluminium provide lighter weight and excellent wear and erosion resistance.
- High-density platform geared toward faster machining cycles to help lower overall costs.
- All pockets are adjustable. Very-user friendly for axial adjustment less than 0,005mm, with a total adjustment of 0,8mm.
- Two grades, KD1400™ and KD1425™, provide options in maximising efficiencies based upon application.
- Roughing, semi-finishing, and fine-finishing with one platform.
- Two corner radii — 0,8 and 2,4mm.
- Mini-tip insert for finishing applications.
- All standard inserts have a 1,5mm wiper facet for better surface qualities.
- Full face wiper available as a standard item.

Delivering Customer-Driven Performance for 20+ Years.

PCD Custom Solutions for Indexable Milling

- Diameters up to 550mm.
- Integral shank options, ie, HSK.
- Left-hand rotation.
- Internal coolant capable.
- PCD lengths up to 12,7mm.
- Specific edge preps and nose radii available.

Insert Setting and Fine Adjustment Procedure

Face Mills

- Apply a small amount of lubricant to the following areas:
  - — Pocket area where the wedge slides.
  - — Threads of the inserts locking screw.
  - — Threads of the axial adjustment screw.
- Install inserts applying light torque to the wedge assembly locking screw.
- Turn axial adjustment screw until the cartridge is 0,01–0,015mm below the final set height.
- Tighten the wedge assembly locking screw to 3,5 Nm.
  - — 170.170 — Torque Screwdriver **mm #1138787**.
  - — 170.181 — 1/4" Drive Bit — 4mm Hex **mm #1138857**.
- Repeat for all inserts/pockets before final axial setting.
- Final Setting: Turn the axial adjustment screw moving the PCD insert 0,005µm to the final set height. Repeat for all pockets.

General

- Non-contact gages are preferred.
- Contact gages can be used with the following precautions:
  - — Indicator point must be flat and parallel to the base.
  - — Always approach the PCD insert from the relief angle under the PCD segment.
  - — Do NOT let the indicator drop on the PCD segment.
- Remove all worn PCD insert.
- Clean the pockets of the cutter completely.

KBDM Wiper Setup

- Set Wiper 15–20 microns (0.0006–0.0008") higher than standard PCD inserts. The KSDR102S Wiper is designed to be used only with 0.031 corner radius standard inserts in the other pockets.
- At this setting, the wiper radius will cover 7,1mm (0.28") advancement before another wiper would be needed.
- Wiper radius is 762mm (30.0").
- Ideal setup is to use only 1 wiper to achieve best surface quality. Use when Wt is a requirement.

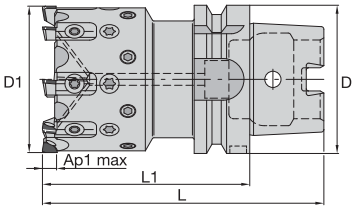
Example: KBDM200SD24 Face Mill
Feed per tooth: 0,2mm (0.008")
# of inserts: 24
Advancement per revolution:
Metric: 0,2 x 24 = 4,8mm
Inch: 0.008 x 24 = 0.192"
4,8mm < 7,1mm wiper length

NOTE: Large diameter cutters 250mm (10.0") & up would be candidates for more than 1 wiper. Due to more inserts in the cutter, the advancement per revolution might exceed the coverage of 1 wiper.

The KSCM™ AluMill™ System

Primary Application

The KSCM AluMill face milling programme is specifically engineered to deliver best-in-class performance in high-volume aluminium machining operations. Runs at higher speeds with no chatter while still easy to adjust. KD1420™ grade materials provide long tool life, and with the Kennametal Blue Box™ programme for reconditioning worn cartridges, you can reduce inventory costs as well!



Features and Benefits

- Anti-vibration cutter design.
- Best rigidity for high feed rates.
- Unique dovetail wedge clamping design.
- No radial movement of cartridges.
- Centrifugal force protection cartridge design.
- Integrated chip gash into cartridge.
- Quick setup and easy adjust concept.
- Flexible cartridge configuration.
- No bur cartridges for fine finishing.
- Blue Box™ service.

- Productivity booster in aluminium face milling.
- Rough and finish in one operation.
- Precision balanceable cutter bodies produce mirror-finish surfaces.

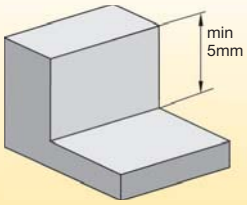
NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

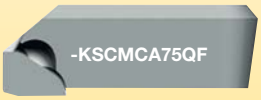
Tool Configuration • Universal Cartridge



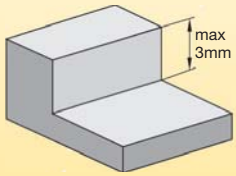
Face milling cutter fitted entirely with universal cartridges.

Depth of Cut:
max 3mm

Surface Quality:
Rz2 - Rz4

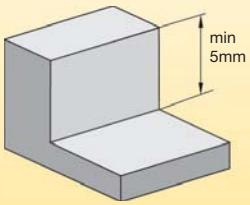


Contouring:
PCD cutting edge length = 5mm

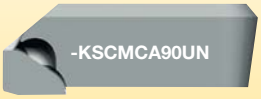


Tool Configuration • Universal Cartridge

+ Finishing Cartridge

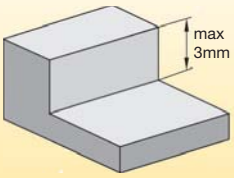


Fitting the face milling cutter with universal and finishing cartridges in a ratio of approximately 3:1.



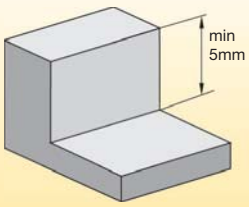
Depth of Cut:
max 3mm

Surface Quality:
Rz1,5 - Rz2,5

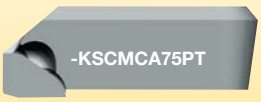


Contouring:
PCD cutting edge length = 5mm

Tool Configuration • Edge Cartridge

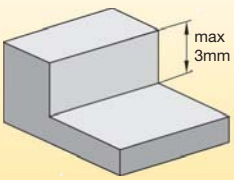


Fitting the face milling cutter entirely with edge cartridges.



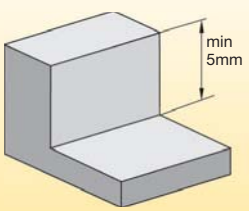
Depth of Cut:
max 3mm

Surface Quality:
Rz2 - Rz4



Contouring:
PCD cutting edge length = 5mm

Tool Configuration • Cartridge for Defined Surfaces



Fitting the face milling cutter entirely with cartridges for defined surfaces.

Depth of Cut:
max 3mm

Surface Quality:
Rz3,2 - Rz17

Contouring:
PCD cutting edge length = 5mm

Tool Configuration • Universal Cartridge, 75° Face Milling

1. Insert cartridges into the body.
2. Screw in the clamping screws (RH), and tighten to 10 Nm.
3. Screw in the adjusting screws (RH), and tighten to 3 Nm.

4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

Tool Configuration • Universal Cartridge + Finishing Cartridge (Ratio Approx. 3:1), 75°

1. Insert universal cartridges at ratio of approximately 4:1 in the body. Make sure they are evenly distributed!
2. Screw in the clamping screws (RH), and tighten to 10 Nm.
3. Screw in the adjusting screws (RH), and tighten to 3 Nm.

4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

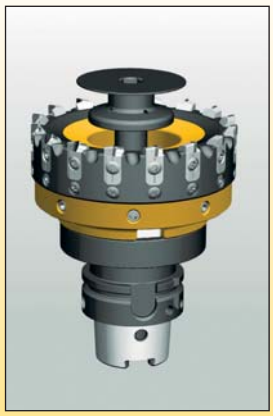
6. Insert finishing cartridges as described in Steps 1–5 but with an axial advance of 0,008 +0,002mm. Max permitted runout error of 3 µm with finishing cartridges.

Tool Configuration • Edge Cartridges, 90° Shoulder Milling

1. Insert cartridges into the body.
2. Screw in the clamping screws (RH), and tighten to 10 Nm.
3. Screw in the adjusting screws (RH), and tighten to 3 Nm.

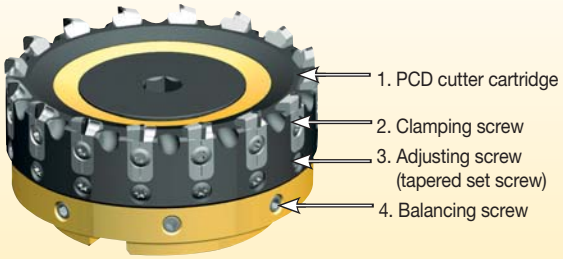
4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

Tool Configuration • Cartridge for Defined Surface, 75°



1. Insert cartridges into the body.
2. Screw in the clamping screws (RH), and tighten to 10 Nm.
3. Screw in the adjusting screws (RH), and tighten to 3 Nm.

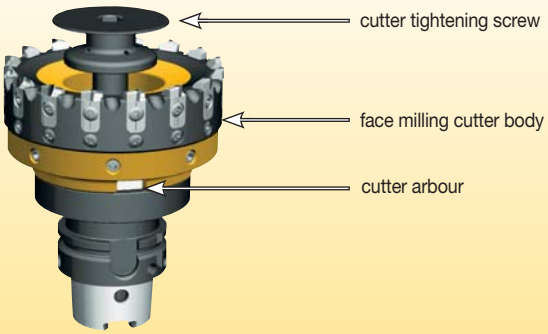
4. Determine which cartridge is in the highest axial position.
5. By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.



NOTE: The process must be repeated when the cartridges are changed. To dismantle, remove the adjusting element (Part 3), clamping screw (Part 2), and cartridge (Part 1).

Instruction for Mounting the Face Milling Cutter on the Appropriate Toolholder

User Information:

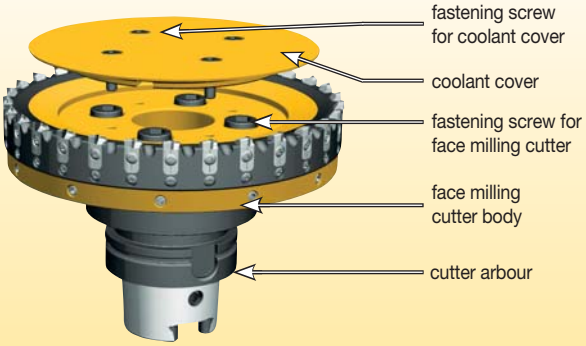


- Tools conform to EN ISO 15641.
- Absolute cleanliness must be observed when assembling the face milling cutter.
- An optimum cutting result will only be achieved by adjusting and balancing the complete tool system (face milling cutter + toolholder).
- Balancing is achieved with the aid of the balancing screws. Quality class G2.5 DIN-ISO 1940.
- The balancing screw must not protrude above the body.
- The balancing and adjustment screws have an adhesive coating according to DIN 267, Part 28. If, after repeated use, the coating is no longer adequate to secure the screws, the screws must be replaced.
- The maximum permitted operating speed (quoted on the tool) must not be exceeded.
- The maximum permitted operating speed is only permitted with clamping systems manufactured by Kennametal in accordance with DIN 69982 Form B with enlarged plane bearing surface. Reduce the operating speed if clamping systems with increased projection length or made by other manufacturers are used.
- Tools and fittings are to be serviced and repaired by Kennametal.
- Screws sealed with lacquer have been adjusted by the manufacturer, and must not be moved.

Instructions for Fitting the Cutter Cartridge • Tool Construction

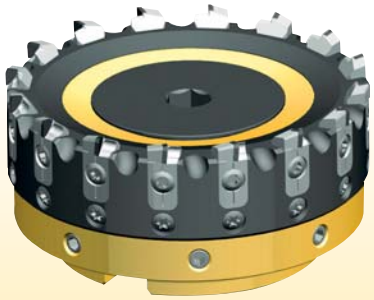
When mounting the face milling cutter (dimensions similar to DIN 8030 Form B), place the body of the face milling cutter on the arbour. Ensure that the contact faces are clean. Screw in the cutter fastening bolt (RH) and tighten with the appropriate torque.

Tightening torque for the central cutter tightening screw:
M20 (adaptor diameter 40): **250 Nm**
M16 (adaptor diameter 32): **150 Nm**
M12 (adaptor diameter 27): **80 Nm**



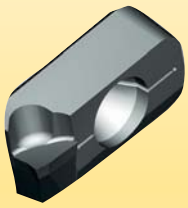
Mounting the Face Milling Cutter (Dimensions Similar to DIN 8030 Form C)

Place the body of the face milling cutter on the arbour. Ensure that the contact faces are clean. Screw in the fastening bolt (RH) and tighten with the appropriate torque. Put the aluminium coolant cover in place and fasten with the Torx fastening screws.



Tightening torque for the face milling cutter fastening screws:
M20: 250 Nm
M16: 110 Nm
M12: 50 Nm

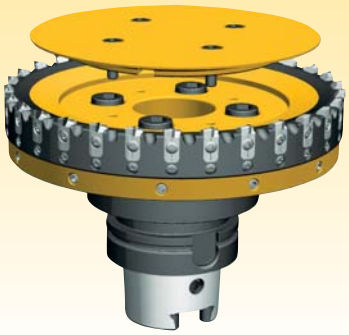
Tightening torque for the coolant cover fastening screws:
M8: 18 Nm



KSCM AluMill
Reconditioning Service

BLUE BOX™
Kennametal

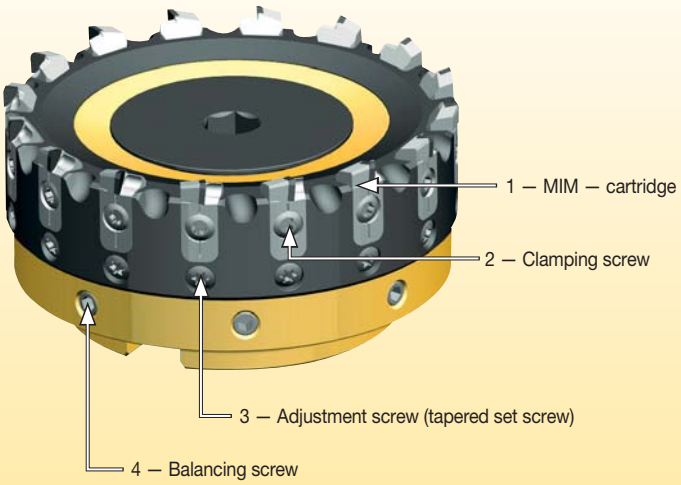
New Supply



On request, the face mill will be delivered with cartridges already mounted and adjusted.

Service Level • PCD Insert Reconditioning

Reconditioning of PCD cartridges up to three times.



- Tool diameter and length remain constant.

Face mill will be delivered with exchanged cartridges already mounted, adjusted, and balanced.

Tool Design

Information:

- KSCM tools conform to EN ISO 15641.
- Absolute cleanliness is needed when assembling the cutter.
- For optimum results, adjust and balance the complete tool system (face milling cutter + toolholder).
- Balancing is achieved with the aid of balancing screws. Quality class G2.5 DIN-ISO 1940.
- The balancing screw must not protrude above the body. The balancing and adjustment screws have an adhesive coating according to DIN 267, Part 28. After repeated use, the coating may no longer be adequate to secure the screws; the screws must be replaced.
- Do not exceed the maximum operating speed.
- Maximum operating speed is only permitted with clamping systems manufactured by Kennametal in accordance with DIN 69982 Form B with enlarged plane bearing surface. Reduce the operating speed if clamping systems with increased projection length or made by other manufacturers are used.
- Tools and fittings are to be serviced and repaired by Kennametal.
- Screws sealed with lacquer have been adjusted by the manufacturer, and must not be moved.
- A centrifugal force test was done.
- If the tools will be used for HSC, referred to in DIN EN ISO 15641, machines have to fulfill the special safety requirements.

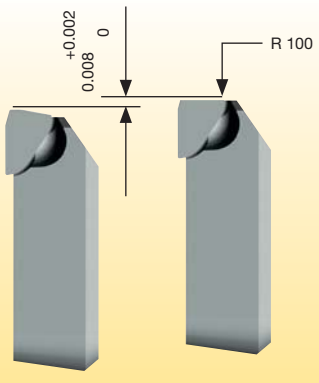
Assembling

1 Lubricate small cove on the MIM cartridge with copper paste of Liqui Moly.

2 Insert universal cartridges at approximate ratio 3:1 into the body. Make sure that they are distributed evenly!

3 Screw in the clamping screws (RH) and tighten to 8 Nm.

4 Screw in the adjusting screws (RH) and tighten to 3 Nm.

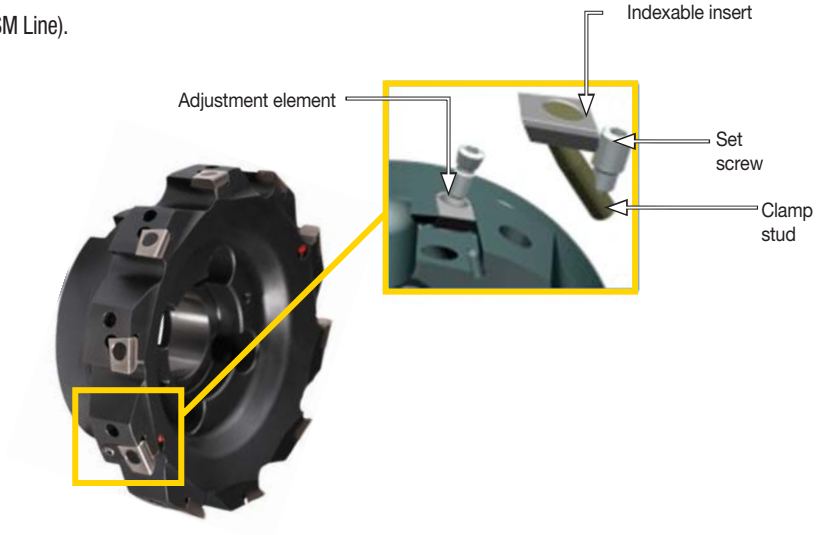


5 Determine which cartridge is in the highest axial position.

6 By turning the adjusting screws to the right, adjust the remaining cartridges for even running. Max permitted runout error 3 µm.

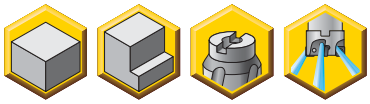
7 Insert finishing cartridges as described in steps 1–6 with an axial advance of 0,008 +0,002mm. Max permitted runout error of 3 µm with finishing cartridges.

NOTE:
- The process must be repeated when the cartridges are changed. To dismantle, remove the adjusting element (Part 3), clamping screw (Part 2), and cartridge (Part 1).
- For special requirements, e.g. surface quality, the configuration and the adjustment of the tool and inserts have to be done in relation with these requirements.
- If spare parts have to be ordered, reference the drawing.

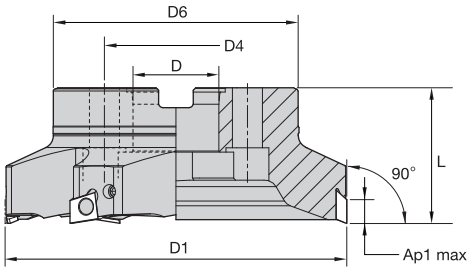


Fix-Perfect™ 90° Aluminium

Primary Application



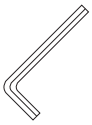
The Fix-Perfect 90° milling cutter is excellent in machining aluminium and non-ferrous materials. The 24° positive rake provides free cutting action while producing superior finishes and flatness.



Features and Benefits

- Achieve true 90º shoulder.
- Roughing and finishing in one tool.
- Full safety first insert clamping.
- Easy adjustable pocket seats for fine finishing (PM, HPM, HSM Line).
- Achievable floor surface quality: Ra = 0.5.
- Very soft cutting action.
- Axial depth of cut Ap1 max = 9,5mm.

- Excellent for milling aluminium and non-ferrous materials.
- Good choice for thin wall or poorly fixtured workpieces.
- 24° positive rake provides free cutting action.
- Produces excellent finish and flatness.
- Maximum speed is 2000 m/min.
- All pockets are fixed pockets.



Fix-Perfect • Shell Mills • M Line • Fixed Pockets

NOTE: Please order spare parts separately.
For all diameters: adjusting element screw **193.326**.
If the adjusting element needs to be replaced, please return the cutter to the Kennametal Service Center.
Torque wrench (DTQ50140, order number 6197561) and 3mm hex bit (BTQSW3L90, order number 6205876) may be purchased separately to ensure proper torque setting.

- Produces excellent finish and flatness.
- All pockets are adjustable.
- First choice for high-speed machining.

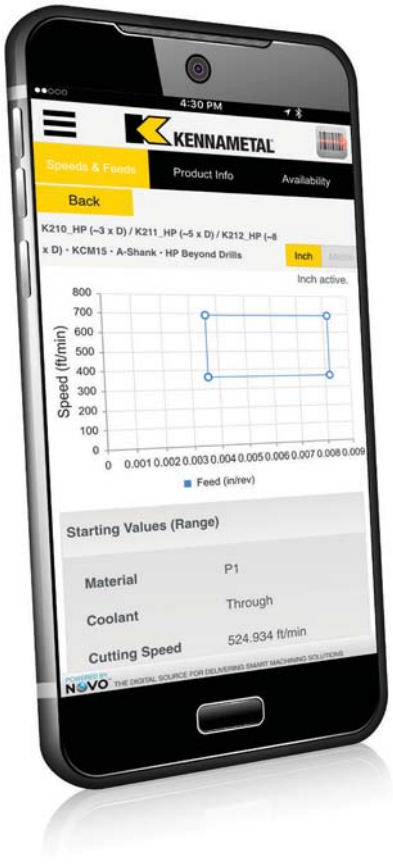
Finishing indexable inserts
BGHX15L5PC..GG.1W



Clean dust, grease, etc., from the insert seat, insert (1), and clamp stud (2).

	PM	HPM/HSM	PM/HPM/HSM
1	Loosen the adjusting element (4).  Loosen the adjusting screw (5).	Loosen the adjusting element (4).  Loosen the adjusting screw (5).	Loosen the adjusting element (4).  Loosen the adjusting screw (5).
2	Insert the indexable inserts and tighten with the clamping screw (3) 5 Nm.  ATTENTION: Ensure that the insert is correctly positioned in the insert seat.	Insert the indexable inserts and pre-tighten with the clamping screw (3) 1,5 Nm.  ATTENTION: Ensure that the insert is correctly positioned in the insert seat. Determine which cutting body is the highest on the axis.	Insert the indexable inserts and pre-tighten with the clamping screw (3) 1,5 Nm.  ATTENTION: Ensure that the insert is correctly positioned in the insert seat. Determine which cutting body is the highest on the axis.
3	Tension the adjusting element (4) by tightening the adjusting screw (5) to the specified torque of 0,5 Nm. 	Extract by 0,02mm the insert that is axially the highest by turning the adjusting screw (5).  Adjust the remaining inserts to the desired runout with maximum travel of the inserts 0,2 Nm.	Adjust the finishing indexable insert(s) to the desired projection, preferably 0,04mm by turning the adjusting screw (5).  ATTENTION: Ensure that the insert is correctly positioned in the insert seat.
4	 **Adjustment element to be replaced by Kennametal Service Center only.**	Clamp the insert by tightening the clamping screw (3) to the specified torque of 5 Nm. 	Clamp the insert by tightening the clamping screw (3) to the specified torque of 5 Nm. 

Mobile App

The Kennametal mobile app makes it easy to access product information, calculators, and much more from iPhone® and Android™ devices.

FEATURES

Scan a Kennametal tool package barcode or search a product catalog number to access complete product information.

Product information includes tool image, dimensions, grades, and product highlights.

View product availability at global locations.

Get speed and feed information in inch and metric values for all metalcutting products.

View tech tips for helpful solutions to common machining questions.

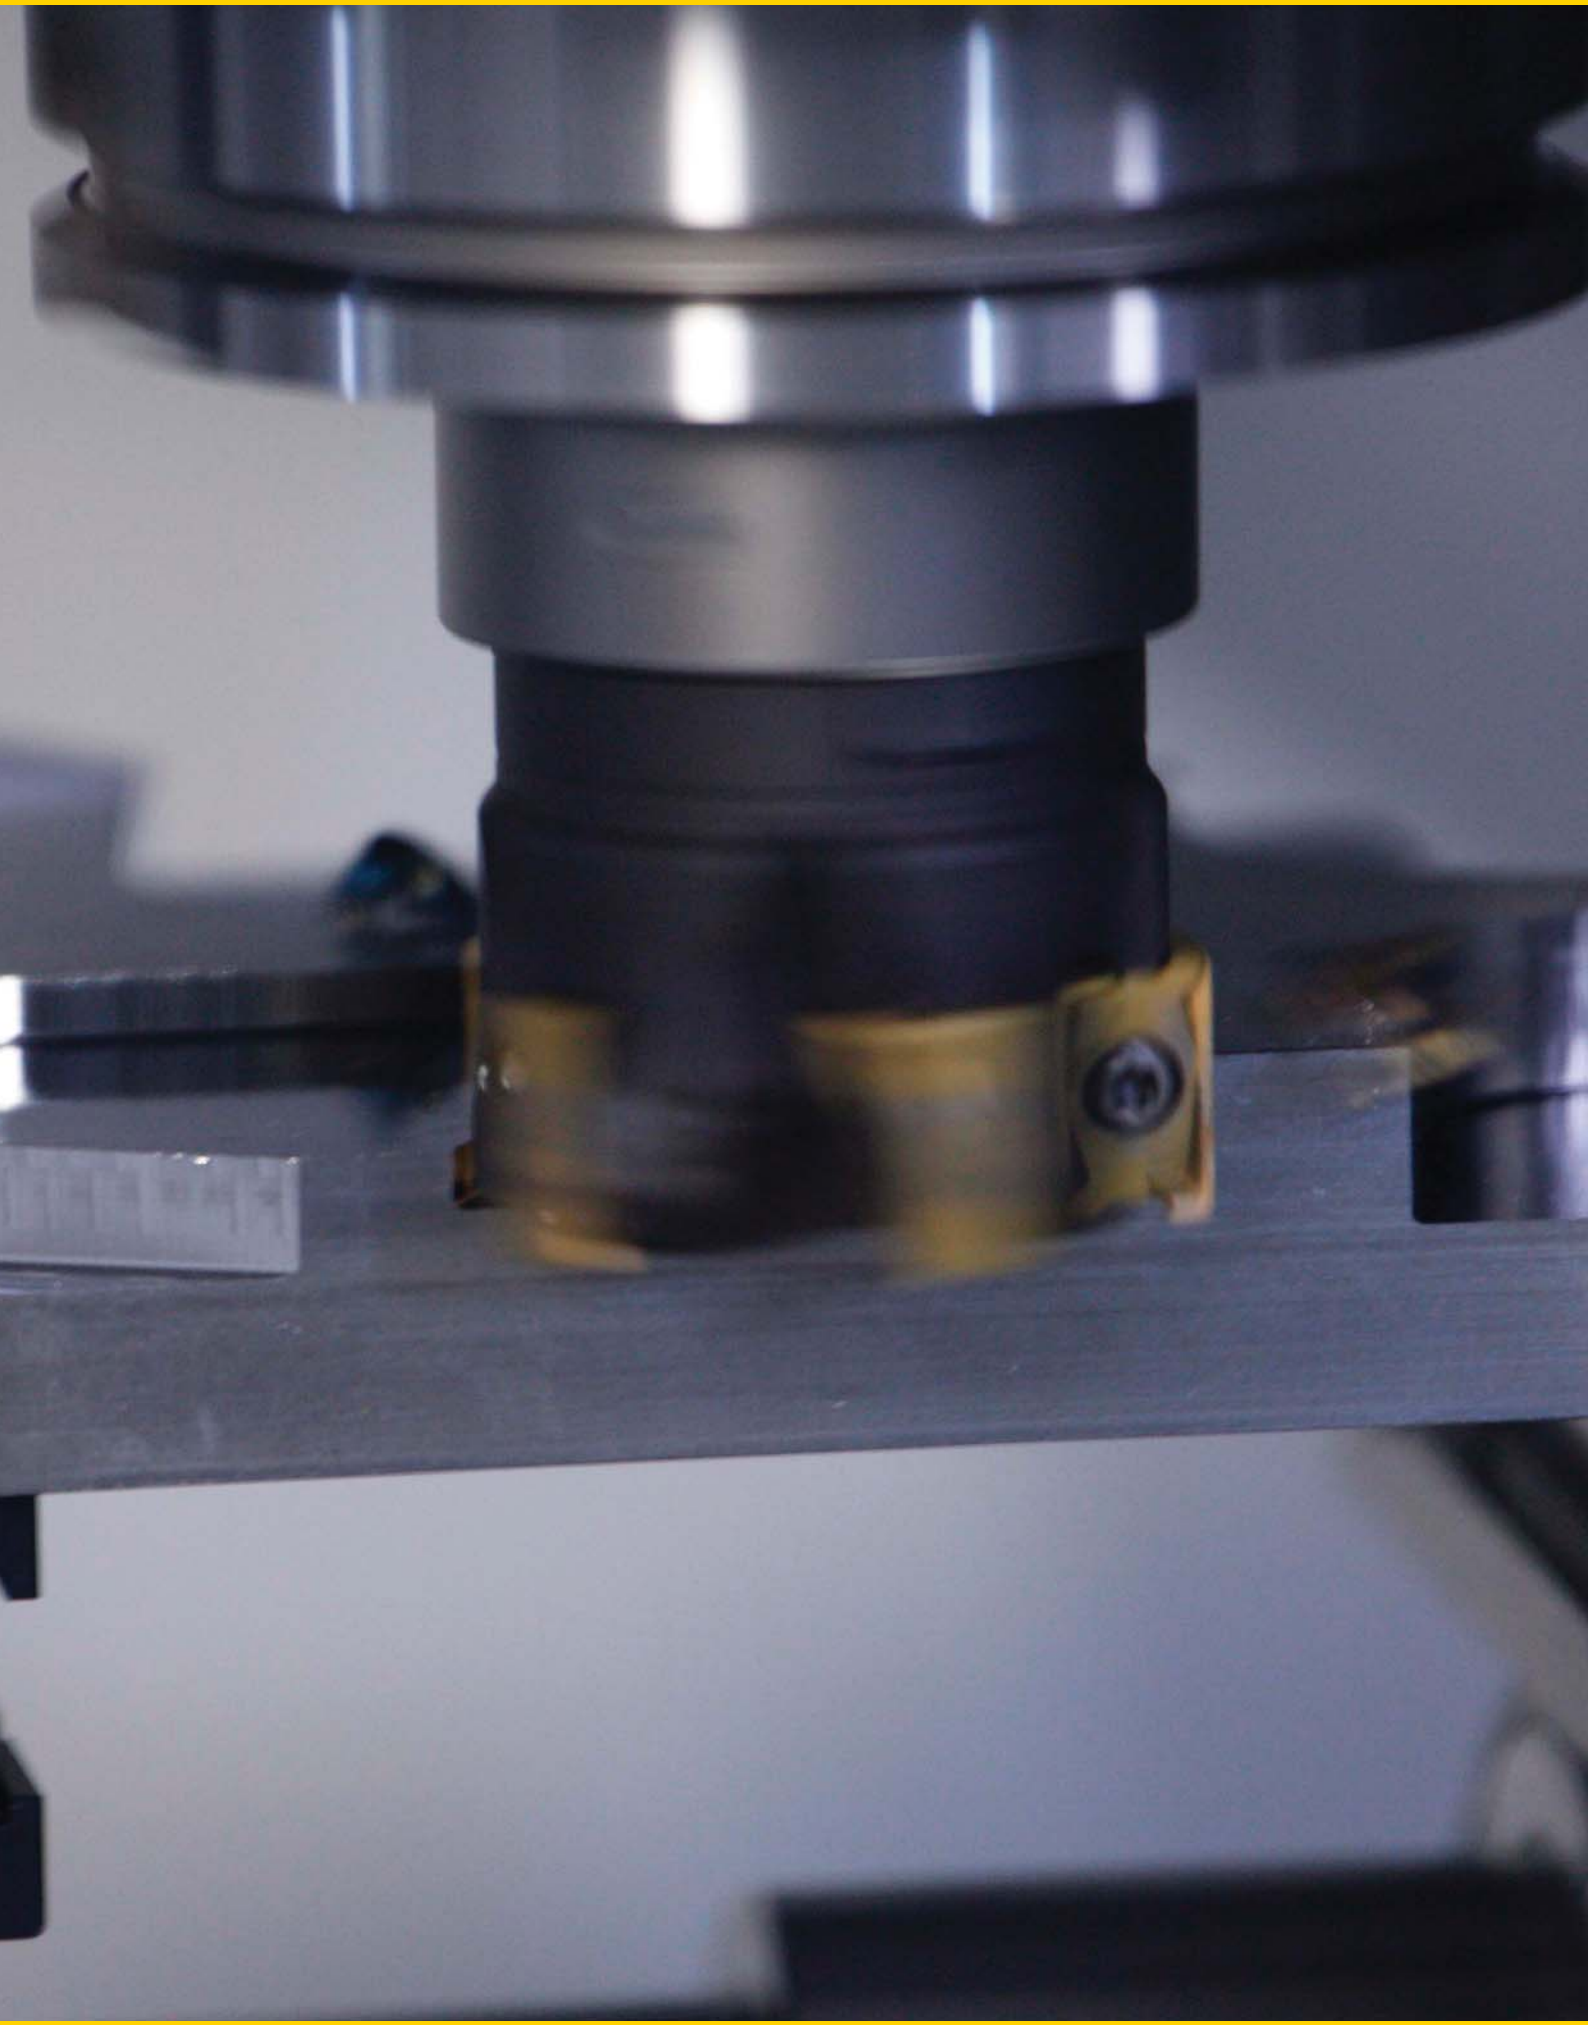
Contact Customer Support directly from the app.

MACHINING CALCULATORS

View data for milling and drilling applications.

Inch and metric values calculated.

ORDERING



Login using your Konnect credentials to complete a purchase.

WHERE TO FIND IT

Download the free app today from iTunes® or the Google Play™ store.

ANDROID APP ON Google play

Available on the App Store

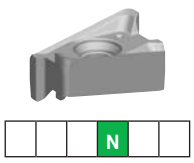
Mill 4-11™

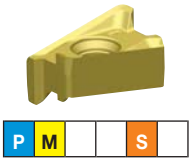
One tool for all applications.



The Mill 4™ series is specially engineered to achieve excellent surface quality and higher metal removal rates in shoulder milling applications. Its unique design allows you to apply the tool in multiple passes (stepping down) with outstanding results.

From roughing to finishing operations, the Mill 4 series is applicable in a wide range of workpiece materials: steel, cast iron, stainless steel, non-ferrous materials, and high-temp alloys.

Features and Benefits

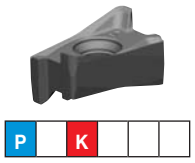


- Double-sided strong insert with 4 cutting edges.
- High positive geometry for lower cutting forces.
- Superior wall and surface finish capabilities.
- “Stepless” solution for multiple-pass operations.
- Comprehensive offering to cover all applications in all material groups.

-ELEJ

For non-ferrous materials.

-EGE



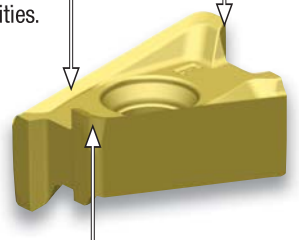
1st choice for stainless steel. Lower cutting forces.

-SGE

First choice for the Mill 4 platform, especially when machining steels.

-SGEM

1st choice for cast iron. Strongest cutting edge.

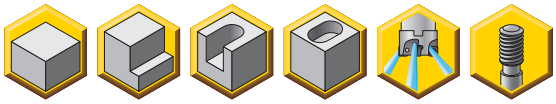


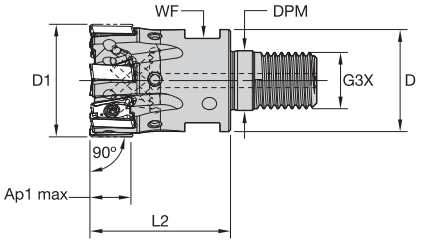
Uneven pocket spacing.

Screw-on, end mills, and shell mill cutter with internal coolant.

Integrated wiper facet for best-in-class floor finisher.

Up to 11mm Ap capabilities.





Multiple corner nose radii available from 0,4mm up to 1,6mm.

Double-sided insert with 4 cutting edges.

TP9 insert screw (M3) to provide higher reliability and safe processes.

- One tool for all applications: from roughing to finishing.
- Superior wall and surface finishing capabilities. Best choice for stepping down operations.
- Up to 11mm depth of cut.
- Screw-on cutters provide better rigidity and stability when used with small spindles: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

- -SGE is the universal geometry for Mill 4-11. First choice when machining steel, as well as stainless steel and high-temp alloys in heavy applications.
- Precision-pressed insert is a perfect choice for roughing operations with a better cost per edge and great surface quality.

Looking for a product that’s not shown in this catalogue?

Check the Kennametal website!

Online product catalogue available 24/7

Visit **kennametal.com/IndexableMilling** to browse our electronic catalogue any time you’re looking for the best Kennametal tooling solutions.

It’s fast, free, and always available. The online e-catalogue is updated weekly with products and solutions for milling, turning, holemaking, and tooling systems applications.

Mill 4-11 Starter Kits

Order one of our starting kits and test the performance of our new Mill 4™ platform. The kits are set up to serve the majority of shoulder milling applications, delivered with a cutter body as well as 20 inserts from a premium Kennametal grade.

Detailed order information can be found in the table below.

Order one Mill 4 kit and experience the next level of shoulder milling!

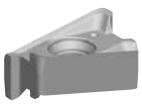
Mill 4-15™ • Double-Sided Shoulder Milling



Primary Application

The Mill 4-15 series is specially engineered to achieve excellent surface quality and higher material removal rates in shoulder milling applications. Its unique design enables multiple passes (stepping down) with outstanding results. The Mill 4™ platform is applicable in a wide range of workpiece materials: steel, cast iron, stainless steel, and titanium, from roughing to finishing operations.

Features and Benefits

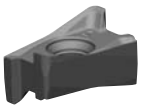
- Double-sided strong insert with 4 cutting edges.
- High positive geometry for lower cutting forces.
- Superior wall and surface finish capabilities.
- "Stepless" solution. No mismatch when machining walls in different steps.

-EGEJ

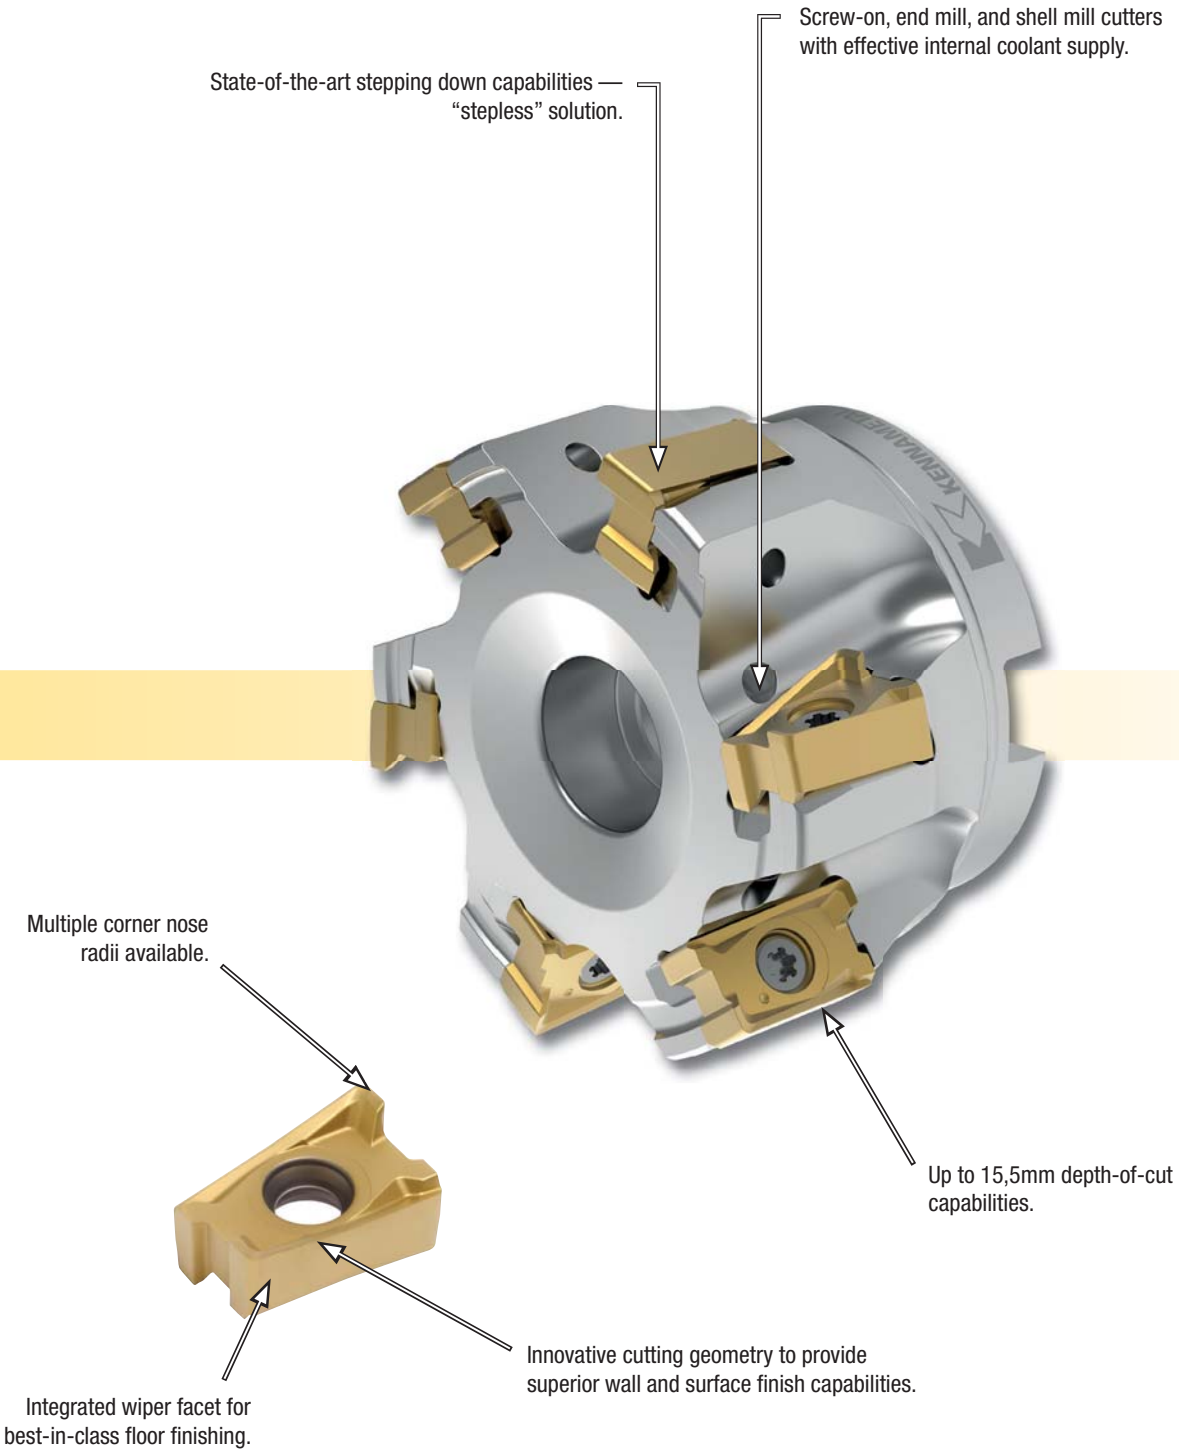
For non-ferrous materials.

-EGE

1st choice for stainless steel. Lower cutting forces.

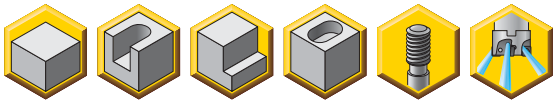


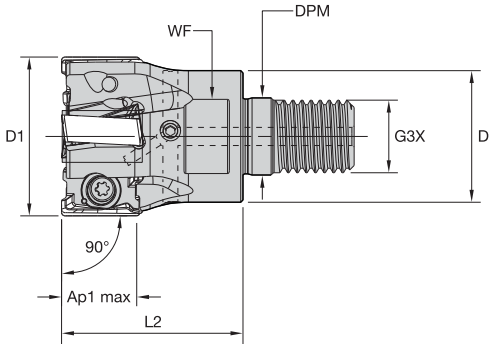
-SGE



First choice for the Mill 4 platform, especially when machining steels.

-SGEM





1st choice for cast iron. Strongest cutting edge.

Screw-on, end mill, and shell mill cutters with effective internal coolant supply.
State-of-the-art stepping down capabilities — "stepless" solution.
Multiple corner nose radii available.
Up to 15,5mm depth-of-cut capabilities.
Innovative cutting geometry to provide superior wall and surface finish capabilities.
Integrated wiper facet for best-in-class floor finishing.

- Superior wall and surface finish capabilities.
- True 90° capabilities. Stepless solution when using multiple steps.
- Engineered to run up to 15,5mm depth of cut.
- Effective internal coolant feature, reaching the cutting edge precisely.

Screw-On End Mills

Mill 1-7™

Primary Application

Mill 1-7 is engineered for small-component machining and covers multiple applications, including ramping, slotting, and plunging. Mill 1-7 tools provide solutions for roughing and finishing operations in energy, aerospace, and general engineering, where small-diameter end mills are required.

Features and Benefits

- Mill 1-7 inserts enable the use of higher density cutters, providing greater feed and higher metal removal rates.
- Super positive rake provides soft action and low cutting forces for smooth entry and exit from the component. Run at higher feed rates while using less power.
- Inserts are designed with elliptical cutting edges and are optimised for a straight 90° wall.
- Inserts are available in five grades: KC725M™, KCSM30™, KCPM40™, KCPK30™, and KC522M™.
- Ramping, slotting, and plunging capabilities in one platform.

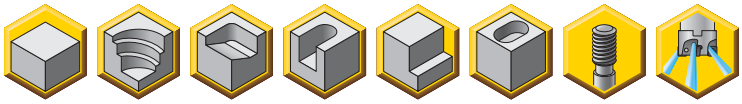
High-Performance Shoulder Mill

20º rake face angle and 13º clearance angle for soft cutting action and reduced cutting forces.

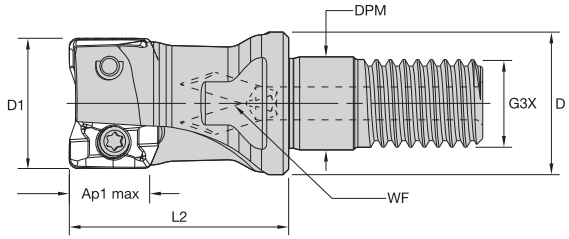
Internal coolant/air supply.

All pockets are machined into heat-treated material, which guarantees runout and pocket strength.

Elliptical edge generates 90º wall.



Chip gash designed for excellent chip evacuation.



Margin along the main cutting edge and wiper facet for extra strength.

Insert screw: Torx 6.

Increase ramping capability up to 5.5º.

- Mill 90° walls.
- Aggressive ramping rates.
- High-speed machining.
- Ramp, slot, plunge, face, and shoulder milling.

Titanium and Stainless Steel Machining with New Milling Grade KCSM40™

Achieving maximum metal removal rates with highly engineering solutions from Kennametal.

- Ideal for roughing and semi-finishing operations.
- Available for the following milling series:
  - Mill 1™
  - Mill 4™
  - Dodeka™
  - MEGA™
  - KSOM™
  - NGE
  - KSSM™
  - KSSM8+™
  - Rodeka™
  - 5230 Series
  - 7713 Series
  - 7792 Series
- This new carbide substrate provides toughness and fatigue resistance, minimising the tendency for thermal cracking.
- The new coating provides high hot hardness and high abrasive resistance for unmatched tool life.
- KCSM40 milling grade is the first choice for high metal removal jobs in titanium structural aerospace components.
- Proven solution for various stainless steel applications, like machining automotive turbo chargers.

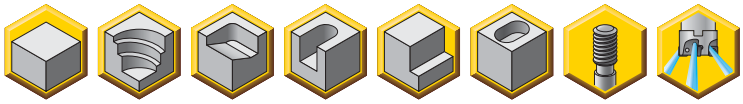
Mill 1-10™

High-Performance Shoulder Milling Platform

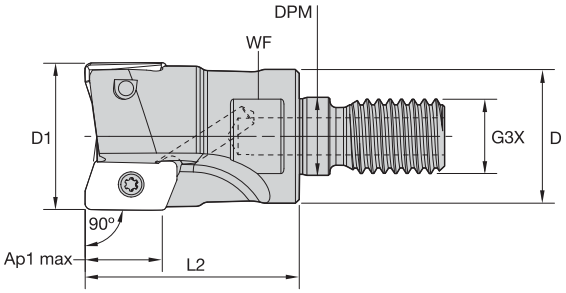
Primary Application

The multifunctional Mill 1-10 platform works with all tool materials in shoulder, ramp, slot, plunge, and helical milling with one insert style to improve productivity and reduce inventory and machining costs. The super positive cutting rake, soft cutting action, and low cutting forces enable higher feed rates and spindle protection. Innovative insert and cutter body designs offer improved ramping capabilities.

Features and Benefits



Versatility



- Works with all tool materials.
- Capable of shoulder, ramp, plunge, and helical milling.
- Internal coolant and air supply.

Advantages

- Optimised soft cutting edge.
- Elliptical edge generates 90° wall.
- Increased ramping capability due to state of the art insert and cutter body design.
- Innovative chip gash design for excellent chip evacuation and perfect cutter body stability.
- All pockets are machined into heat-treated materials, guaranteeing best-in-class runout and pocket strength.
- Inserts feature innovative margin along the main cutting edge, corner nose radius, and wiper facet for perfect edge stability.

- Ramping capable for all Mill 1-10.
- Generates superior surface finish.
- Mill 90° walls.
- High RPM capabilities.

42	**MS2205**	1,0	**F7IP**

NOTE: Standard milling cutters will accept insert nose radii up to 2mm without modification.

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 90° walls.
- High RPM capabilities.

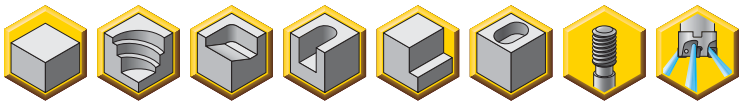
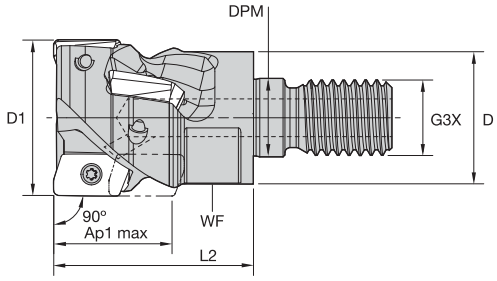
NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Application Data





Application Examples

insert style	cutting diameter	max ramp angle to non-cutting corner tangent	max ramp angle to steel body interference	DH min (min hole diameter)	DHI min (min flat-bottomed hole diameter)	max diameter (no flat bottom)
Mill-1, 10mm	12	not recommended	not recommended	not recommended	not recommended	not recommended
Mill-1, 10mm	16	9,7°	12,3°	19,50	28,73	32
Mill-1, 10mm	18	7,6°	9,6°	23,29	32,68	63
Mill-1, 10mm	20	6,2°	8,6°	27,25	36,63	40
Mill-1, 10mm	22	5,2°	7,0°	31,25	40,63	44
Mill-1, 10mm	25	4,2°	5,3°	37,26	46,62	50
Mill-1, 10mm	28	3,5°	4,3°	43,26	52,62	56
Mill-1, 10mm	32	2,8°	3,3°	51,27	60,62	64
Mill-1, 10mm	40	2,0°	2,3°	67,30	76,61	80
Mill-1, 10mm	42	1,9°	2,1°	71,32	80,60	82
Mill-1, 10mm	50	1,5°	1,6°	87,53	96,86	100
Mill-1, 10mm	63	1,2°	1,2°	113,54	122,86	126
Mill-1, 10mm	80	0,9°	0,9°	147,54	156,85	160
Mill-1, 10mm	100	0,7°	0,7°	187,54	196,85	200

NOTE: Max ramp angle decreases as nose radius increases.

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 90° walls.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Flange Mount Adaptors

For HARVI™ Ultra Helical Cutters

HARVI ultra helical cutters can be used with our flange mount adaptors to create a powerful combination on nearly all spindle connections on the market.

Our flange mount adaptors enable the same cutting tool to be easily adapted to different machine spindle connections.

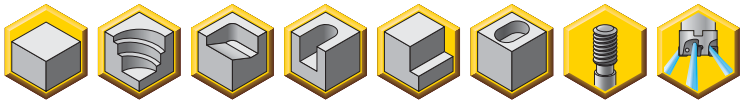
Mill 1-14™

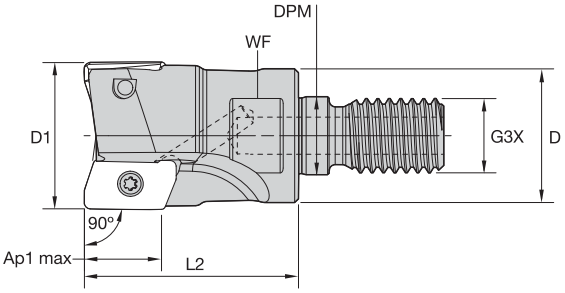
Primary Application

The Mill 1-14 series is a versatile, functional cutter system for a range of cutting tasks. Mill 1-14 cutters can be used for profiling, slotting, ramping, helical interpolation, circular interpolation, and other milling applications. It's a single tool with multi-functional benefits. Mill 1-14 inserts are specially designed to add cutting versatility. Innovative micro-geometry features contribute greatly to enhanced performance, various rake angles, negative T-land, and small hone. Results include significantly reduced cycle times and lower cutting forces. Test results in producing 90º walls have proven excellent with the GD2 geometry.

Features and Benefits



Features



- Insert geometries and grades for most workpiece materials.
- Insert radii from 0,15mm up to 4mm.
- Axial depth of cut up to 14mm.
- Beyond™ grade technology.

Benefits

- Easy cutting action, even on entry and exiting the workpiece.
- Polished geometry for aluminium machining.
- Slotting, profiling, ramping, helical interpolation, and plunging.

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 90° walls.
- High RPM capabilities.

Screw-On End Mills

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Application Examples

insert style	cutting diameter	max ramp angle	DH min (min hole diameter)	DHI min (min flat-bottomed hole diameter)	max diameter
Mill 1-14	20	16°	23,74	35,62	40
Mill 1-14	25	11°	33,75	44,44	50
Mill 1-14	32	7°	47,80	59,79	64
Mill 1-14	40	5°	63,76	75,22	80
Mill 1-14	40	5°	64,00	75,47	80
Mill 1-14	50	4°	83,96	96,05	100
Mill 1-14	63	3°	109,93	121,47	126
Mill 1-14	80	2°	143,91	155,47	160
Mill 1-14	100	1°	183,89	199,47	200
Mill 1-14	125	1°	233,88	245,47	250
Mill 1-14	160	1°	303,88	315,47	320

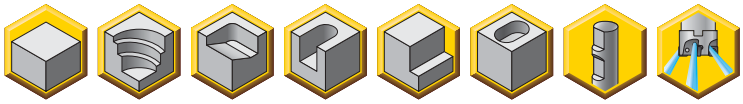
NOTE: Max ramp angle decreases as nose radius increases.

Mill 1-14™
Helical Cutters

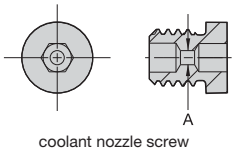
Primary Application

Mill 1-14 helical cutters will increase axial depth of cut. Designed with axial support pins for added stability, the Mill 1-14 helical cutters feature essential Load-Optimised Insert Spacing™ (LOIS) technology. LOIS dramatically minimises unwanted vibrations and fluctuations in power requirements, resulting in a much smoother-sounding cut. Up to nine different coolant nozzle diameters enable tailoring to suit each machine tool, providing remarkably consistent, focused coolant flow.

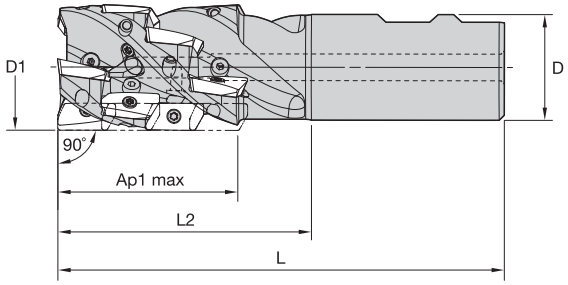
Features and Benefits



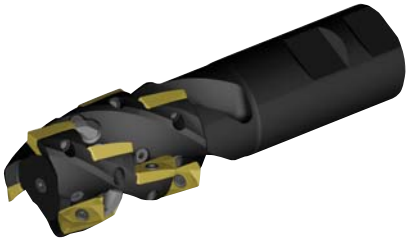
Functions



- Improves axial depth of cut better than standard end mills due to the positioning of inserts in helical configuration.
- Up to nine different coolant nozzle diameters tailored to suit each machine tool.
- One tool that offers features common to end mills, but rarely seen on a helical cutter: Helical ramping from solid, slotting, contouring, ramping, and plunging.



Benefits



- Increases depth of cut.
- Consistent, focused coolant flow.
- Built for performance, accuracy, and versatility.

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 90° walls.
- Axial support pins.
- Unique coolant nozzles.

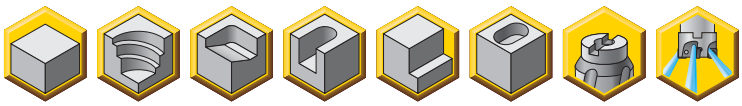
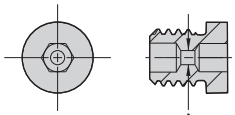
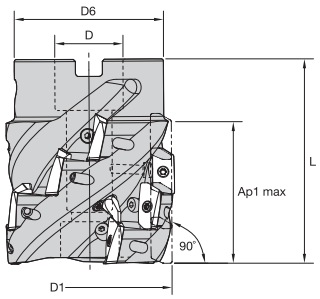
Coolant Nozzle Key







order number	catalogue number	drive size
1993552	THW2M	2 MM

NOTE: Check the spare parts table for the coolant hole size that is incorporated in the cutters.
If you need an alternative, there are eight other variants to choose from to increase or decrease the pressure.
Example: MS2191C12 is a 1,20mm hole. All coolant nozzles are interchangeable with the original that is supplied with the cutter.
This gives flexibility with coolant flow.

- Aggressive ramping rates.
- Generates superior surface finish.

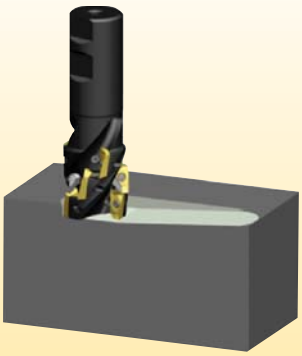
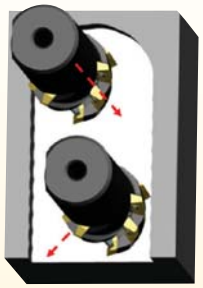
Mill 1-14	50	2.7°	83,96	96,05	100
Mill 1-14	63	1.9°	109,93	121,47	126



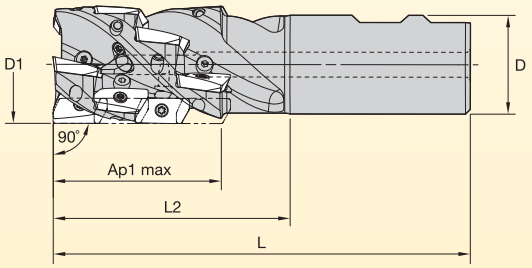
Best Machining Practices

Contouring/Profiling
ae = up to 50% of cutter Ø. This can be used with or without coolant/air blast, depending on materials being machined.

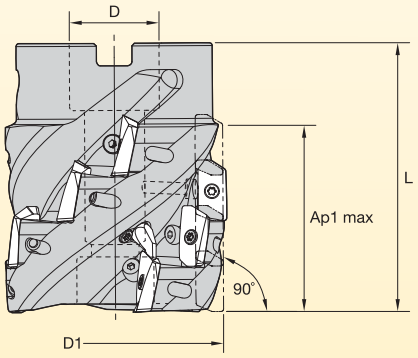


Slotting
Full width cutting or profiling over 50% of the cutter Ø. It is suggested to use coolant or air blast to evacuate chips. If necessary, reduce coolant nozzle hole size, which adds more pressure, and the chip is forced out of the chip gash.

Ramping
Only machine to the depth of the first insert. Observe the ramping angles given in the catalogue.



Slotting by Plunging



Slot with the alternate side method, alternating the cuts from side to side. This will enable the cutter to move away from the material prior to moving back up in the Z-axis. The cutter will not be in contact with the workpiece. Follow the direction of the arrows. Move 3 axes simultaneously into the centre of the slot. Maximum step over 8,0mm (0.315").

With multiple Z-axis passes, when the final depth is achieved, move straight back up in the Z-axis, then repeat at the next step over.

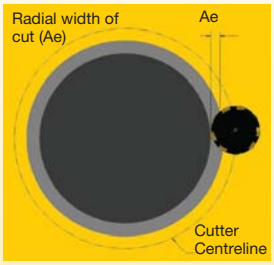
[1] Number of effective flutes.
[2] Mounting style: W = Weldon®; S = Shell Mill.
[3] Max ramp angle when radial depth of cut exceeds 8mm (.31")
[4] Max insert corner radius allowed in first row without cutter body modification.
[5] Recommended for profiling applications only.

Profile, Slot, and Ramp

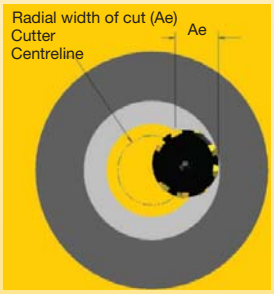


When taking a cut that equals up to 50% of the cutter diameter, you can operate without coolant, unless your material is coolant-dependent. When using more than 50% of the cutter diameter, there is a need to have coolant through the nozzles, or an air blast through the nozzles. This will assist with chip evacuation. Please use the feed table when taking a small percentage of the cutter diameter. This will improve the volume of material removed. To achieve a superior surface finish on the base, adjust the feed to suit the finish required.

When using this cutter for plunging, the maximum suggested step over is 3,30mm (.130"). Always try to move the cutter and insert away from the material when retracting in the Z-axis. This can be done when employing the alternate cut method (zig zag method). Use a 3-axis move to get all axes moving at the same time, suggest 0,25mm (.010").

When machining a conventional slot, you have to move straight up in the Z-axis.

Circular and Helical Interpolation



External

When profiling around the external part of a component, it is important to increase the feed rate. This will maintain the chip thickness value.
The programmed feed rate needs to be calculated at the cutter centreline.

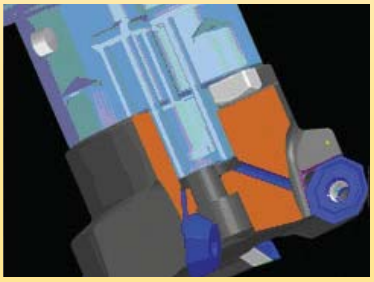
For external profiling, adjust the feed rate for feed at the cutter centreline.
Increase the feed rate for external profiling.

Internal

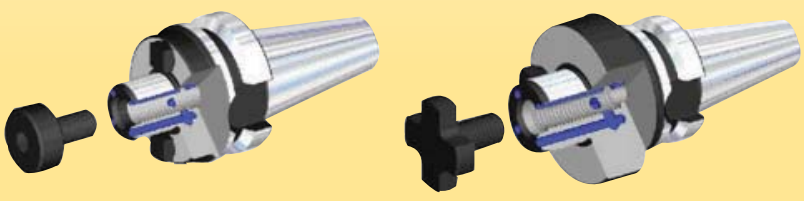
When machining inside a component profile, the area of contact is larger.
The feed rate needs to be at the centreline, and the feed rate needs to be slower.

For internal profiling, adjust the feed rate for feed at the cutter centreline.
This will effectively reduce the feed rate as the distance traveled is less than the peripheral distance.

Cutting Data



Reference pages X22–X37 for speed tables. Reference platform pages for feed data.
Each insert has an average chip thickness value that will enable you to determine the feed per tooth.



Please remember when using less than 50% of the cutter diameter, the feed rate will need to be increased.
Failure to do so will result in premature insert failure. Running too slowly will reduce tool life.

Spare Parts

Please make sure all the spare parts in the cutters are fully tightened prior to using the product. Shell mill cutters no longer have coolant grooved bolts. We now have adaptors that will enable the coolant to be fed through the adaptor pilot diameter.

True Through Coolant Shell Mill Adaptors

CONTACT US

Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

FIND A LOCAL AUTHORISED DISTRIBUTOR IN YOUR AREA

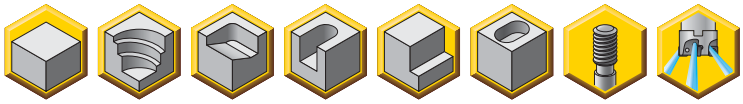
Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

Mill 1-18™

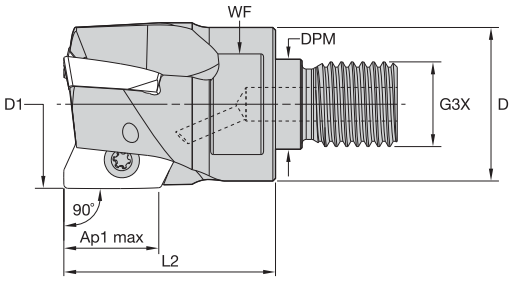
Primary Application

The Mill 1-18 series is a versatile, functional cutter system for a range of cutting tasks. Mill 1-18 cutters can be used for profiling, slotting, ramping, helical interpolation, plunging, and other milling applications. It's a single tool with multi-functional benefits. Mill 1-18 inserts are specially designed to add cutting versatility, especially for larger axial depths of cut. Results include significantly reduced cycle times and lower cutting forces.

Features and Benefits



Features



- Inserts for larger axial depth of cut.
- Inserts radii up to 6,35mm.
- Axial depth of cut up to 18mm.
- Cutter diameters up to 160mm.
- Beyond™ grade technology.

Benefits

- Slotting, profiling, ramping, helical interpolation, and plunging.
- Angled screw for insert retention.
- Insert geometries and grades for most workpiece materials.

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 90° walls.
- High RPM capabilities.

Screw-On End Mills

- Aggressive ramping rates.
- Generates superior surface finish.
- Mill 90° walls.
- High RPM capabilities.

Indexable Inserts

- Light edge prep for reduced cutting forces.
- Periphery ground for high-precision machining.
- Light machining and finish applications.
- Ap1 max = 18mm.

Please see pages X22–X37 for recommended starting speeds.

Application Data

Application Examples

insert style	cutting diameter	max ramp angle	DH min (min hole diameter)	DHI min (min flat-bottomed hole diameter)	max diameter (no flat bottom)
Mill-1, 18mm	25	17°	29,24	45,84	50
Mill-1, 18mm	32	11°	42,98	59,84	64
Mill-1, 18mm	40	8°	58,92	75,84	80
Mill-1, 18mm	50	5°	78,88	95,84	100
Mill-1, 18mm	63	4°	104,86	121,84	126
Mill-1, 18mm	80	3°	139,02	156,5	160
Mill-1, 18mm	100	2°	179,00	196,5	200
Mill-1, 18mm	125	2°	228,98	246,5	250
Mill-1, 18mm	160	1°	298,98	316,5	320

NOTE: Max ramp angle decreases as nose radius increases.

Carbide Recycling

Help preserve and protect our planet!

It's easy for your company to be environmentally conscious with the Kennametal Carbide Recycling Programme.

By sending us your used carbide tools, you help preserve and protect the environment and ensure that these products are recycled responsibly. Kennametal accepts any coated or non-coated carbide items, including inserts, drills, reamers, and taps.

By using the Kennametal Carbide Recycling Programme, you will receive:

- A partner who cares about a sustainable environment.
- Easy-to-use web portal to value your used carbide.
- Access to our popular Green Box™ options for carbide collection.
- Systematic and efficient disposal of carbide materials.
- Improved profitability.

Programme is not currently available in all geographical areas.
For more information, please visit **kennametal.com/carbiderecycling**.

KENNAMETAL®

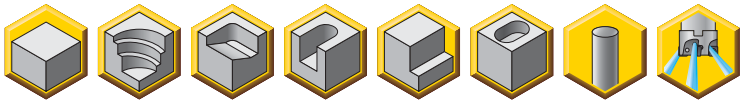
Mill 1-25™

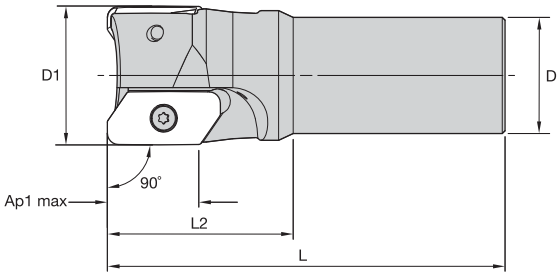
Primary Application

Also known as Mill1 Max, the Mill 1-25 cutter is made specifically for aluminium machining, but can also be used when machining cast iron. High-feed capabilities enable routing applications with an axial depth of cut of up to 25mm.

Features and Benefits



Functions



- Strong, thick inserts over 5,2mm thick.
- Axial depth of cut up to 25mm.
- Cylindrical, monoblock/HSK63A, and shell mills.

Benefits

- Made for machining aluminium, but also used for machining cast iron.
- High-feed capability for routing applications.
- Balanced-by-design — if running over 10,000 RPM, balance the cutter assembly.

- Roughing and finishing of aluminium alloys.
- Aggressive ramping angles.
- High-speed capability.
- Ap1 max = 25mm.

Cylindrical End Mills

order number	catalogue number	D1	D	L	L2	Ap1 max	Z	max ramp angle	kg	max RPM

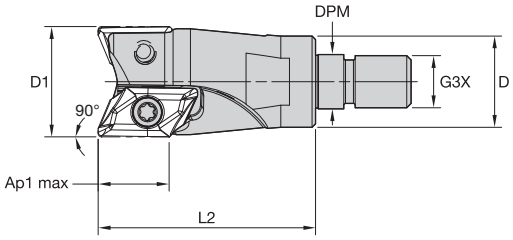
Stellram® 5720VZ16 Series

Taking extreme high-speed aluminium machining to the highest level.

Features and Benefits

- Specially designed for machining pockets and profiles on aluminium and aluminium alloys.
- The 5720VZ16 series is designed, manufactured, and tested in accordance with EN ISO 15641:2001 to ensure maximum stability in high-speed applications.
- The internal coolant enables better chip evacuation and higher feed rates.
- The pockets are reinforced to enable for heavy feeding and safe ramping during machining. These features increase tool life and productivity.
- Excellent tools for thin-walled machining due to very low cutting pressure.
- Twelve different insert radii are available, each with the same cutting depth capacity of 16mm.
- Cylindrical shank and HSK63A integral shanks are designed and balanced to G6.3 at 30,000 RPM for diameters up to 50mm. Diameter larger than 50mm are balanced to G6.3 at 24,000 RPM.

Monoblock cutters with HSK63A are available as standard in diameters 25, 32, 40, and 50mm.



The Stellram® 5720VZ16 cutters are our latest design for high metal removal in aluminium applications.

Maximum ap = 16mm
Diameter Range = 25–80mm

- High-speed profiling and pocketing aluminium alloy components in the aerospace industry.
- Maximum stability in high-speed applications.
- Through-tool coolant allows better chip evacuation and higher feed rates.

Screw-On End Mills

order number	catalogue number	D1	D	DPM	G3X	L2	Ap1 max	Z	max ramp angle	kg	max RPM

(continued)

Machinability

A Excellent
B Good-to-Excellent
C Good
D Not Good

$Vc = \pi \times D \times n/1000$ m/min = mm x RPM

D: Tool diameter, N: RPM, Vc: Cutting speed, $\pi = 3.1416$

Choose a cutting speed in the range of values, compatible with the cutter max rotation capacity (engraved on the body) and your spindle stability.

Recommendations for High Speed Machining at 8,000 RPM or above

- Check spindle condition:
  - Runout
  - Clamping of the attachment in traction
  - Marking and cleanliness
- Check that the tool is suitable for the required use.
- Inserts must be locked positively in the pocket and secured using the torx screw provided. The screw must be torqued to the correct value as indicated in the charts on the product pages.
- Because of heavy force to the screw, it is important to change the screw when changing the insert.
- Check the balancing of the assembled tool: cutter body, inserts, and attachment.
- Before start up, note the maximum RPM engraved on the tool. The maximum RPM is linked to a precise balancing value.
- Ensure that the field of application of the tool shown in our technical documents and technological parameters is observed:

A_e (mm)	width of cut, lateral engagement (radial)
a_p (mm)	Axial depth of cut
f_z (mm/tooth)	Feed per tooth
n (RPM)	revolutions per minute

Kennametal cannot accept responsibility for misuse of this product due to:

- Non-observance of the above instructions
- Machine without casing
- Incorrect clamping of workpieces
- No safety device on the machine
- Any misuse or incorrect clamping

The optimum rotation must be determined by condition of the spindle.
The spindle must be rigid to run at these higher RPMs.

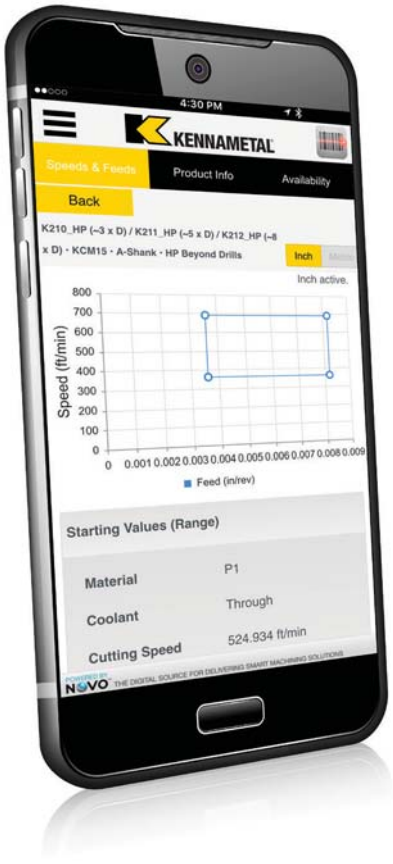
Under no circumstances must any attempt be made to repair this tool.
The only permitted maintenance is the indexing or replacement of the inserts.

When assembling the cutter to a Shrink Fit holder, the maximum protrusion cannot exceed 10% of the reach of tool.

Balancing:

- Cylindrical shank and HSK63A integral shanks are designed and balanced to G6.3 at 30,000 RPM for diameters up to 50mm. Diameter larger than 50mm are balanced to G6.3 at 24,000 RPM.
- Cylindrical shank tools mounted in a Shrink Fit holder or any other chuck mill holder + inserts + screws must be re-inspected for balance as an assembly by the end-user when at or exceeding 8,000 RPM. End-user must balance the assembly at a G6.3 at 30,000 RPM maximum.
- Shell mill and modular head cutters are not balanced. These tools must be re-inspected for balance as an assembly, cutter + inserts + screws, by the end-user for high speed machining at 8,000 RPM or above. End-user must balance the assembly at a G6.3 value minimum.
- Balancing requires removing some material by drilling or milling operations. To avoid making modular heads weaker, limit these operations by avoiding high RPM. It is not recommended to remove material by drilling operation.
- For each new modular head added to the same extension, re-balance the assembly. For each new shell mill installed on the same toolholder, re-balance the assembly.

Tighten the modular head to the extension; with lubricant, apply the torque value of:



Thread sizes (mm)	Torque Values Nm
M6	10
M8	30
M10	50
M12	80
M16	110

Tighten the bolt between the shell mill and toolholder; with lubricant, apply the torque value of:

Thread sizes (mm)	Cutter Bore Size (mm)	Torque Values Nm
M6	13	10
M8	16	30
M10	22	50
M12	27	80
M16	32	110
M20	40	120

Mobile App

The Kennametal mobile app makes it easy to access product information, calculators, and much more from iPhone® and Android™ devices.

FEATURES

Scan a Kennametal tool package barcode or search a product catalogue number to access complete product information.

Product information includes tool image, dimensions, grades, and product highlights.

View product availability at global locations.

Get speed and feed information in inch and metric values for all metalcutting products.

View tech tips for helpful solutions to common machining questions.

Contact Customer Support directly from the app.

MACHINING CALCULATORS

View data for milling and drilling applications.

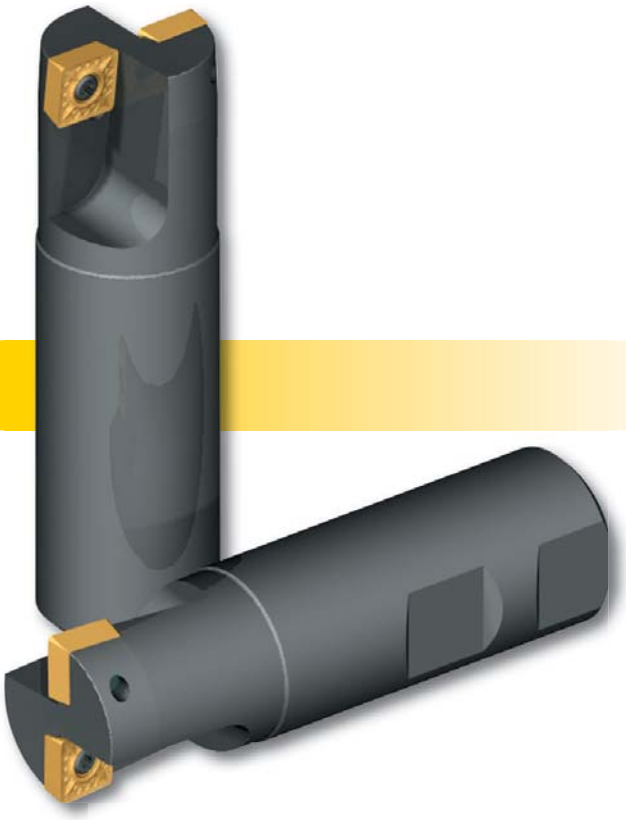
Inch and metric values calculated.

ORDERING

Login using your Konnect credentials to complete a purchase.

WHERE TO FIND IT

Download the free app today from iTunes® or the Google Play™ store.



ANDROID APP ON Google play

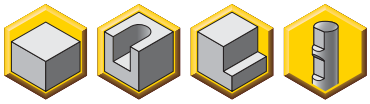
Available on the App Store

KSSM™ Platform

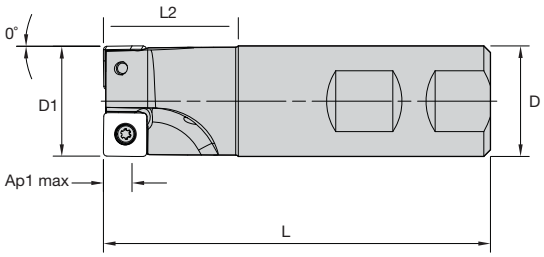
Primary Application

The Kennametal KSSM platform is a versatile solution providing three insert sizes that cover a wide range of applications: face milling, shoulder milling, slotting, profiling, and Z-axis (plunge milling).

Features and Benefits



KSSM IC 10 Inserts



- Four cutting edges.
- Excellent surface finishes.
- Low power requirements.

KSSM IC 12 Inserts

- Four cutting edges.
- Excellent surface finishes.
- Low power requirements.
- Increased depth of cut.

- Mill 90° walls.
- Excellent surface finishes.
- Low power requirements.
- Four cutting edges per insert.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Mill 90° walls.
- Excellent surface finishes.
- Low power requirements.
- Four cutting edges per insert.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Leader in Advanced Face Milling Applications

Dodeka™ Mini

The Dodeka Mini series is the most comprehensive face milling booster on the market today and offers fast, accurate indexing — with only one screw!

It is the first choice for long-reach face milling applications, or light fixtures with up to 40% shorter machining cycle time. With a standard offering of 15°, 45°, and 60° in combination with Beyond™ premium milling grades, expect up to 35% better tool life in light to heavy machining.

Visit **kennametal.com** or contact your local Authorised Kennametal Distributor.

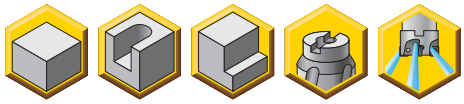
KSSM-KSSP Helical

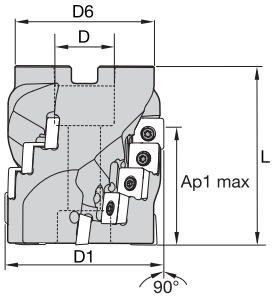
Primary Application

KSSM-KSSP helical cutters were originally developed and proven for the aerospace industry, but are now available for all industries. The proprietary variable rake design minimises vibration and chatter.

Features and Benefits



Features



- Patented HARVI™ technology.
- Progressive helical rakes.
- Unique coolant supply.

Benefits

- Increased tool life in titanium.
- Increased metal removal rates.
- Lower power consumption.
- Ensures chip evacuation, even on exotic materials.

- Patented HARVI™ technology.
- Progressive helical rakes.
- Increased Metal Removal Rates (MRR).
- Excellent surface finishes.
- Low power requirements.
- Four cutting edges per insert.

Shell Mills • Standard Pitch

order number	catalogue number	D1	D	D6	L	Ap1 max	Z	Z U	kg	max RPM

63	**MS1273**	4,0	**MS1238**	**TT15**
80	**MS1273**	4,0	**MS1241**	**TT15**

NOTE: Maximum nose radii of lead insert is 2,4mm for 50mm diameter cutter.
All subsequent inserts up the flutes should have a maximum nose radius of 0,8mm to avoid lap lines.
Standard milling cutters will accept insert nose radii up to 2mm without modification.

5230VS • High Performance Long-Edge Milling Cutters

The Stellram® **5230VS09** and **5230VS12** cutter series is perfectly suited for profiling and full slotting. Designed for high material removal rates in titanium and high-temperature alloys. Several applications have achieved metal removal rates of up to two times greater than the previous operating cutting parameters. The advanced chevron design ensures that one cutting point is always in contact with the material during entrance and exit. This provides optimum harmonic stability resulting in maximum tool life and a 30% improvement in surface finish. A generous flute capacity, coupled with each cutting edge having its own coolant jet, ensures excellent chip evacuation. This works to enhance surface finish and increases metal removal rates for a higher level of productivity.

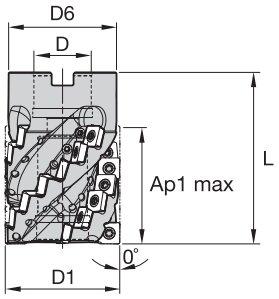
The advanced 5230VS series is ideal for rough machining of steel, alloyed steel, stainless steel, and particularly for titanium and high-temperature alloys.

Features and Benefits

- Insert positioning provides smooth, progressive penetration and cutting action for extended tool life.
- Individual coolant jets to each insert provides constant chip evacuation and temperature stability in the cutting zone.
- The advanced chevron design improves stability and lowers power consumption, increasing tool life up to two times greater than comparable cutter in today's market.
- Proven versatility in wide application area in titanium and high-temperature alloys increasing productivity.

5230VS

5230VS09:



(a_p max is determined by selection of cutter diameter)
Diameter range and maximum a_p= 50mm diameter with a_p 51mm or 80mm

5230VS12:

(a_p max is determined by selection of cutter diameter)
Diameter range and maximum a_p= 63mm diameter with a_p 57mm or 94mm
80mm diameter with a_p 65mm or 110mm
100mm diameter with a_p 76mm or 133mm

- High material removal rates in titanium and high-temperature alloys.
- Chevron design improves stability and lowers power consumption.
- Insert positioning provide smooth progressive penetration and cutting action for extended tool life.
- Individual coolant jets to each insert provide constant chip evacuation and temperature stability in the cutting zone.

Please see pages X22–X37 for recommended starting speeds.

- High material removal rates in titanium and high-temperature alloys.
- Chevron design improves stability and lowers power consumption.
- Insert positioning provides smooth progressive penetration and cutting action for extended tool life.
- Individual coolant jets to each insert provides constant chip evacuation and temperature stability in the cutting zone.

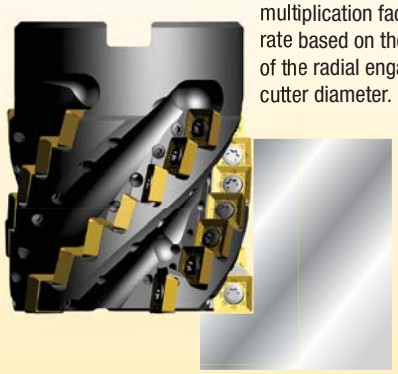
NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Calculation of the average chip thickness in relation with the a_e (Radial Engagement) if a_e is less than 50% of diameter.

Formula: Programme Feed Rate (f_z)

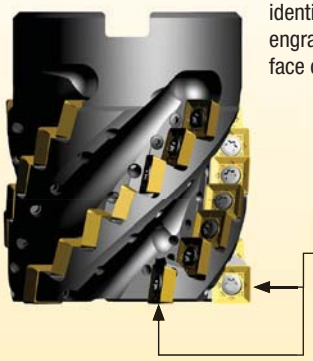
$$f_z = h_m \times \sqrt{\frac{d}{a_e}}$$

h_m = Average chip thickness
a_e = Radial engagement
f_z = Feed per tooth
d = Cutter diameter



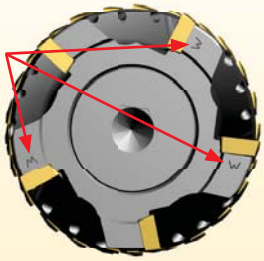
Formula: Average Chip Thickness (h_m)

$$h_m = f_z \times \sqrt{\frac{a_e}{d}}$$

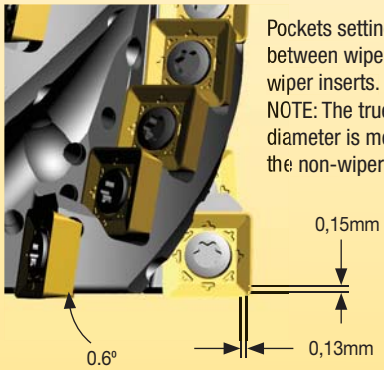


h_m Correction Coefficient Chart

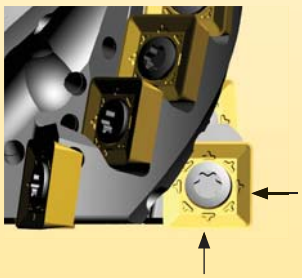
Cutter Ø 50mm			Cutter Ø 63mm			Cutter Ø 80mm			Cutter Ø 100mm		
ae%	ae (mm)	Coefficient Factor	ae%	ae (mm)	Coefficient Factor	ae%	ae (mm)	Coefficient Factor	ae%	ae (mm)	Coefficient Factor
5	2,50	2,30	5	3,15	2,30	5	4,00	2,30	5	5,00	2,30
10	5,00	1,66	10	6,30	1,66	10	8,00	1,66	10	10,00	1,66
15	7,5	1,40	15	9,45	1,40	15	12,00	1,40	15	15,00	1,40
20	10,00	1,25	20	12,60	1,25	20	16,00	1,25	20	20,00	1,25
25	12,50	1,16	25	15,75	1,16	25	20,00	1,16	25	25,00	1,16
35	17,50	1,05	35	22,05	1,05	35	28,00	1,05	35	35,00	1,05
50–100	25,00–50,00	1,00	50–100	31,50–63,00	1,00	50–100	40,00–80,00	1,00	50–100	50,00–100,00	1,00



Example: A 50mm diameter cutter using 5,00mm radial engagement (a_e) = 10% of the cutter diameter. At 10%, your coefficient is 1,66 (see above table); therefore you must multiply your feed rate by 1,66 for correcting the feed for profiling.



The chart above shows the multiplication factor for the feed rate based on the percentage of the radial engagement of the cutter diameter.



Wiper pockets are identified with a W engraved on the face of the body.

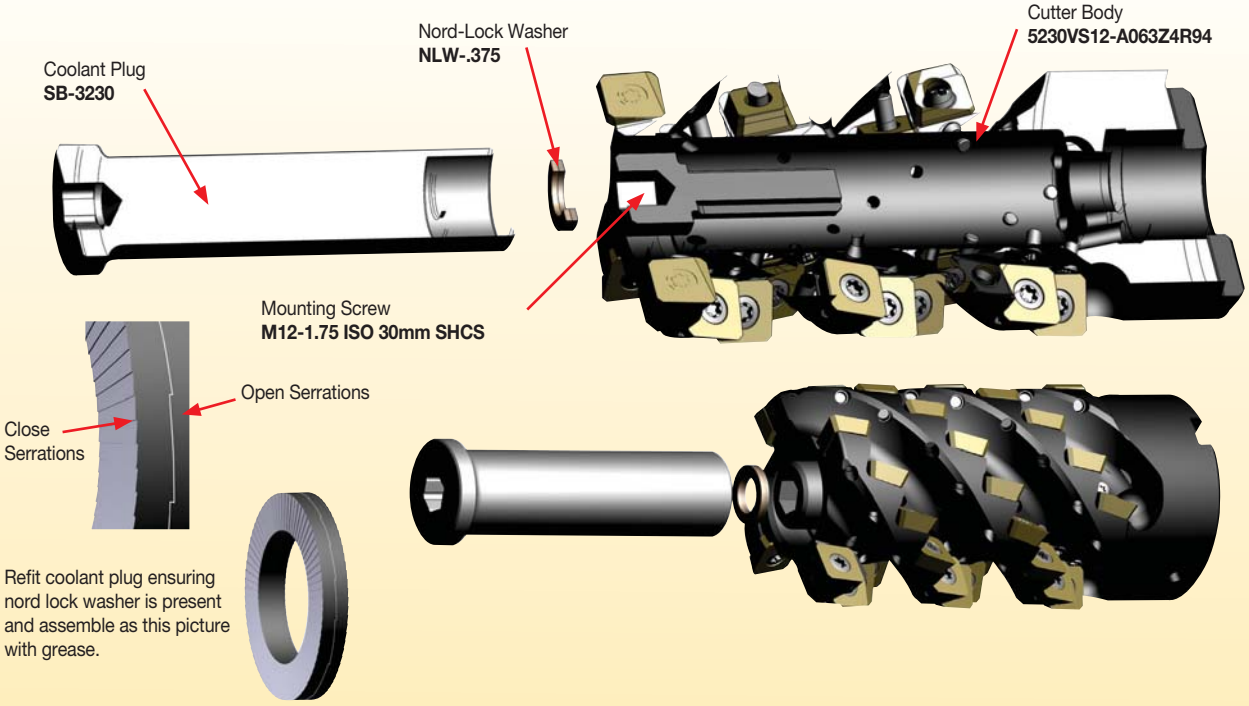
The 5230VS cutter series is designed with wiper pockets which provide a much better face surface finish. The non-wiper pockets generate the 90° corner. The same inserts can be utilised in all pockets.

Pockets setting difference between wiper and non-wiper inserts.
NOTE: The true cutter diameter is measured at the non-wiper pockets.

Non-wiper pocket positions are set back and square to axis to give a true 90° approach.

Wiper pocket positions are in front and angled to allow facing.

Cutter diameter (mm)	Number of Wiper Inserts
50	2
63	2
80	3
100	3



5230VS09 and 5230VS12 Fitting Instructions for Shell Mill Cutters

NOTE: All Shell Mill 5230VS09 and 5230VS12 chevron porcupine cutters are supplied assembled with mounting bolt, nord-lock washer, and steel coolant plug.

Please follow the instructions below to disassemble the cutter, attach the cutter to a shell mill adaptor, and reassemble coolant plug. It is very important to use the proper torque when reassembling the cutter with the mounting bolt, nord-lock washer, and coolant plug.

Example of cutter: 5230VS12-A063Z4R94 assembly

1. Remove coolant plug. *(NOTE: Ensure the nord-lock washer is retained to the bottom of the coolant plug.)*
2. Fit the cutter body to the shell mill adaptor and secure using the mounting bolt supplied with the cutter.
   NOTE: The mounting bolt must be properly torqued to the specific torque setting shown in Detail 1 on page T123.
3. Refit coolant plug ensuring nord-lock washer is present and in the proper location on the bottom of the coolant plug. A small amount of grease can be used to hold the nord-lock washer in place.
4. Tighten coolant plug with specific torque setting shown in Detail 2 on page T123.
5. NOTE: If axial depth of cut (a_p) is less then maximum a_p of cutter, then **F3006T** coolant control screws supplied separately can be used to block coolant holes forcing more coolant to the front of the cutter. If these screws are used, please secure with loctite or similar product.

Torque values for mounting bolts

Excessive condition is when long reach extensions are required or when cutting parameters are elevated to extreme parameters.

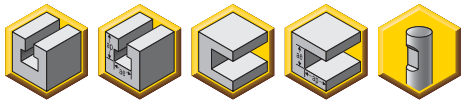
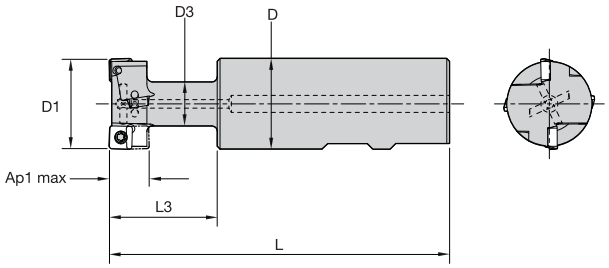
KTMS™ Slotting Cutter

Primary Application

KTMS slotting cutters produce “T” slots in machine beds as well as small radial depths of cut for machining shallow radial slots. There is always a need to prepare the slot before using this type of cutter — preparation is the key to success.



See the technical information for information about the pre-machining on page U5.



Features and Benefits

- Only available in metric dimensions.
- Slot widths from 9–22mm.
- Three different insert sizes.
- Preparing the component before slotting is the key to success.
- Prepare workpiece with a slot.
- Honed insert edges.
- Feed rates between 0,10–0,15mm; lower feed rates will induce vibration.
- Use air flow to evacuate chips.
- Always start the cutting process with a new cutting edge.

- Prepare workpiece with a slot.
- Honed insert edges.
- Feed rates between 0,10–0,15mm; lower feed rates will induce vibration.
- Use air flow to evacuate chips.
- Always start the cutting process with a new cutting edge.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

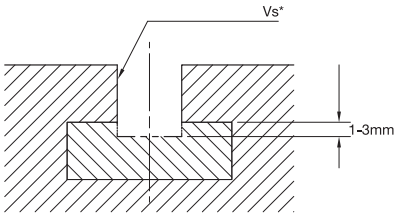

Fig. 1

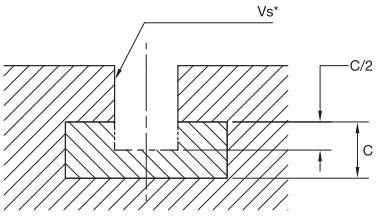

Fig. 2

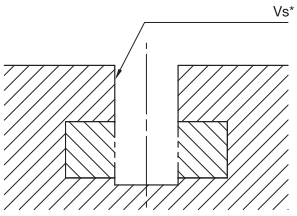

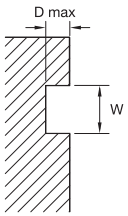

Fig. 3

Side Slotting

Steel

- Machining a vertical slot, depth to be kept at a minimum as shown in Figure 1.
- If the depth is greater than Figure 1, chip evacuation problems could occur.
- Vibrations could occur when the T-slot cutter diameter increases; use Figure 1 as the starting point.
- If chattering is a concern, adopt the Figure 2 solution.

Cast Iron

- Fewer problems with chip evacuation and reduced cutting forces enable deeper vertical slots as shown in Figures 2 and 3.
- Air blast is recommended to disperse the chips; this can be used for steel and cast iron.

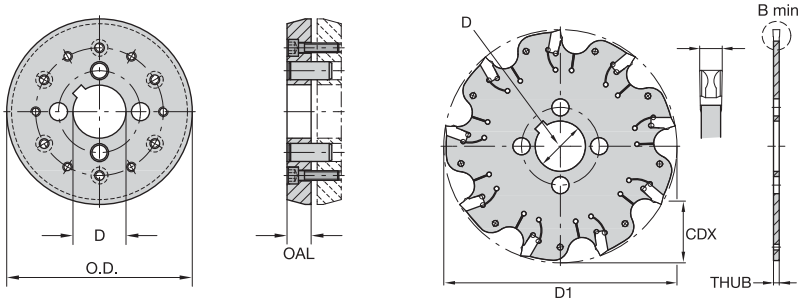
KVNS™ Slotting Cutter

Primary Application



The KVNS slotting cutter enables diameters from 63–250mm and insert widths from 1,6–4mm. It is a perfect solution for small groove widths, grades, and geometries and suits most materials. Drive rings and support rings are available; use these items to get the maximum support for the cutter body.

Features and Benefits

- Slot widths from 1,6–4mm.
- Grades and geometries to suit most workpiece materials.
- Positive chipforming inserts are standard.
- Self-clamping inserts.
- Self-clamping insert seat with fixed stop.
- Excellent for all flat-bottom slotting and cut-off operations.
- Two drive hubs are required for each cutter body, except when using two drive supports.
- Drive rings and support rings available, must be ordered separately (in pairs).

- Positive chip forming inserts are standard.
- Self-clamping insert seat with fixed stop.
- Excellent for all flat-bottom slotting and cut-off operations.
- Two drive rings required for each cutter body (must be ordered separately, in pairs).

Slotting Cutters • Technical Information

Secure clamping self-clamping insert seat for maximum machining safety

Using the assembly wrench:
Fitting the insert

Removing the insert

- Exact position of the insert guaranteed by the positive stop.
- Maximum possible insert repeatability with dual positive prism clamping.
- Powerful, secure clamping guarantees high peripheral speeds.

Titanium and Stainless Steel Machining with New Milling Grade KCSM40™

Achieving maximum metal removal rates with highly engineering solutions from Kennametal.

- Ideal for roughing and semi-finishing operations.
- Available for the following milling series:
  - Mill 1™
  - Mill 4™
  - Dodeka™
  - MEGA™
  - KSOM™
  - NGE
  - KSSM™
  - KSSM8+™
  - Rodeka™
  - 5230 Series
  - 7713 Series
  - 7792 Series
- This new carbide substrate provides toughness and fatigue resistance, minimising the tendency for thermal cracking.
- The new coating provides high hot hardness and high abrasive resistance for unmatched tool life.
- KCSM40 milling grade is the first choice for high metal removal jobs in titanium structural aerospace components.
- Proven solution for various stainless steel applications, like machining automotive turbo chargers.

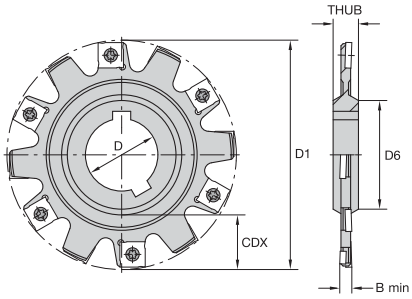
SN Slotting Cutter

Primary Application

SN slotting cutters are perfect for deeper applications that require the cutting load to be shared from one insert to the other. Provides groove widths from 4–14mm and cutter diameters from 80–250mm as well as an economical way to achieve balanced cutting.



Features and Benefits

- Cutters available in arbour mount.
- Inserts with four indexes.
- Staggered key ways in mounting bore, used for multiple ganged cutters.
- Slot width 4–14mm.
- Three insert geometries available: -GP, -GE, and -T.
- Requires only one spare part.

- 4–14mm slot widths range.
- Four indexes per insert.
- Three chip formers available.
- Two keyways for staggered mounting.
- Requires only one spare part.

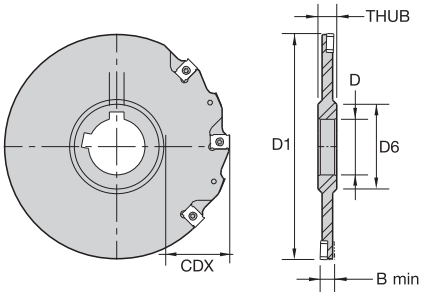
Please see pages X22–X37 for recommended starting speeds.

LN Slotting Cutter

Primary Application



LN slotting cutters offer arbour and shell mill cutter options, groove widths from 6–13mm, and cutter diameters from 80–160mm. Easy to adjust radially in 0,50mm increments.

Features and Benefits

- Cutter available in arbour and shell mounts.
- Groove width 6–13mm.
- Groove width can be increased by 0,5mm or 1mm. Please consult the chart “Technical Information: Possible Insert Combinations”.
  NOTE: This involves changing inserts and insert screws.
- Easy width adjustment through insert thickness.
- Staggered internal keys.
- Positive chip grooves.
- Full side cutting.
- Neutral and positive chip forming inserts are standard.
- Four insert cutting edges.
- Requires only one spare part.

- 6–13mm slot width range.
- Easy width adjustment through insert thickness.
- Full side cutting.
- Neutral and positive chip forming inserts are standard.
- Four insert cutting edges.
- Two keyways for staggered mounting.
- Requires only one spare part.
- Base slot angle: 2°
- Maximum slot width tolerance: +/- 0,05mm

* Caution: Variation in cutting width range limited to one size (thickness) greater than the standard insert thickness.
** When changing to a wider insert thickness, use the necessary longer screw; see chart for detail.
NOTE: When cutters have 3 rows of inserts, the above table only refers to the outer insert on both sides of the cutter.
When using inserts with a radius of 2,40mm or greater there is a need to modify the insert pocket; modify to 2.50 x 45° chamfer.

Example: Cutting Width of 6,50mm

catalogue number	D1	Ap1 max	Ap1 max (new)	side one insert*	screw**	side two insert*	screw**
80Y08RS90LN12N06	80	6	6.5	LNE1235	MS-1280	LNE1240	MS-1281

* Caution: Variation in cutting width range limited to one size (thickness) greater than the standard insert thickness.
** When changing to a wider insert thickness, use the necessary longer screw; see chart for detail.
NOTE: When cutters have 3 rows of inserts, the above table only refers to the outer insert on both sides of the cutter.
When using inserts with a radii of 2,40mm or greater there is a need to modify the insert pocket; modify to 2.50 x 45° chamfer.

Recommended Starting Feeds

Recommended Starting Feeds [mm]

Light Machining	General Purpose	Heavy Machining

Insert Geometry	Recommended Starting Feed per Tooth (Fz) in Relation to % of Radial Engagement (ae)															Insert Geometry
	5%			10%			20%			30%			40–100%			
...	0,17	**0,47**	0,70	0,12	**0,34**	0,50	0,09	**0,26**	0,38	0,08	**0,22**	0,33	0,07	**0,20**	0,30	...
.S..GP	0,23	**0,52**	0,81	0,17	**0,37**	0,58	0,13	**0,28**	0,43	0,11	**0,24**	0,38	0,10	**0,22**	0,35	.S..GP

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

FIND THE LATEST PRODUCT INFORMATION

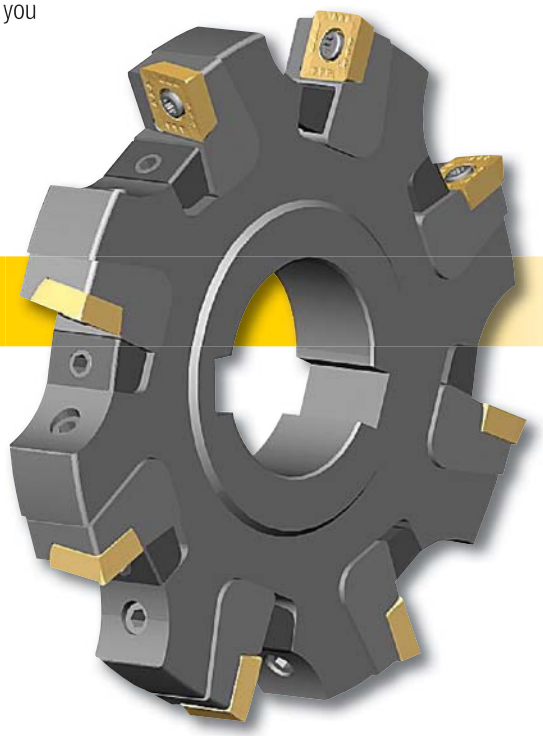
Whether your operation is turning, milling, or holemaking, Kennametal brands are the high-performance tooling you need. We offer standard and custom solutions for a wide range of applications.

Find information about our most current campaigns and catalogues.

Register on Konnect for the full functionality of the Kennametal online ordering website.

CONTACT US

Our customers are important to us. We want to provide you the best customer service in the industry. If you have a comment or question, please send it to us. We strive to respond to all inquiries within 24 hours.

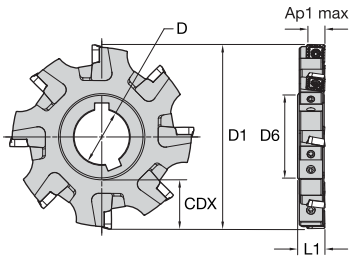


FIND A LOCAL AUTHORISED DISTRIBUTOR IN YOUR AREA

Kennametal offers world-class products and services globally. Our distributors know us, and more importantly, they know you. They know better than anyone in the industry how to put the global power of Kennametal to work for you — in your industry, in your region, and for your business.

KSSM™ Slotting Cutter

Primary Application



Cutters available in fixed and adjustable groove widths: Cutters available in arbour and shell mounts, as well as in fixed and adjustable groove widths, with insert grades and geometries for most materials, KSSM fixed-width slotting cutters are a cost effective solution for the general engineering market. Very precise adjustments to achieve consistent widths are possible with the variable width and enable you to change the tool from right hand to left hand with a change of cartridge.

Features and Benefits

- Cutters available in arbour and shell mounts, as well as in fixed and adjustable groove widths.
- Maximum groove widths:
  - Fixed cutters IC 10: 9,1mm and 15,8mm.
  - Fixed cutters IC 12: 11,7mm and 19,8mm.
  - Adjustable cutters IC 10: 14–18mm.
  - Adjustable cutters IC 12: 18–23,30mm.
- Rapid adjustment mechanism.
- Large selection of insert geometries and grades to cut most workpiece materials.
- Four insert cutting edges.
- Faceted inserts for superior surface finish.
- Cutter diameter range is 100–315mm.
- Insert corner radii from 0,4–6,35mm.

- Right-hand and left-hand cutters with 9,1mm width of cut.
- Large selection of insert geometries and grades to cut most workpiece materials.
- Four insert cutting edges.
- Various radii available.
- Faceted inserts for superior surface finishes.

- Rapid adjustment and setting via unique cam adjustment mechanism.
- Large selection of insert geometries and grades to cut most workpiece materials.
- Four insert cutting edges.
- Wide choice of insert radii.
- Two keyways for staggered mounting.
- Wiper insert facets for superior surface finishes.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

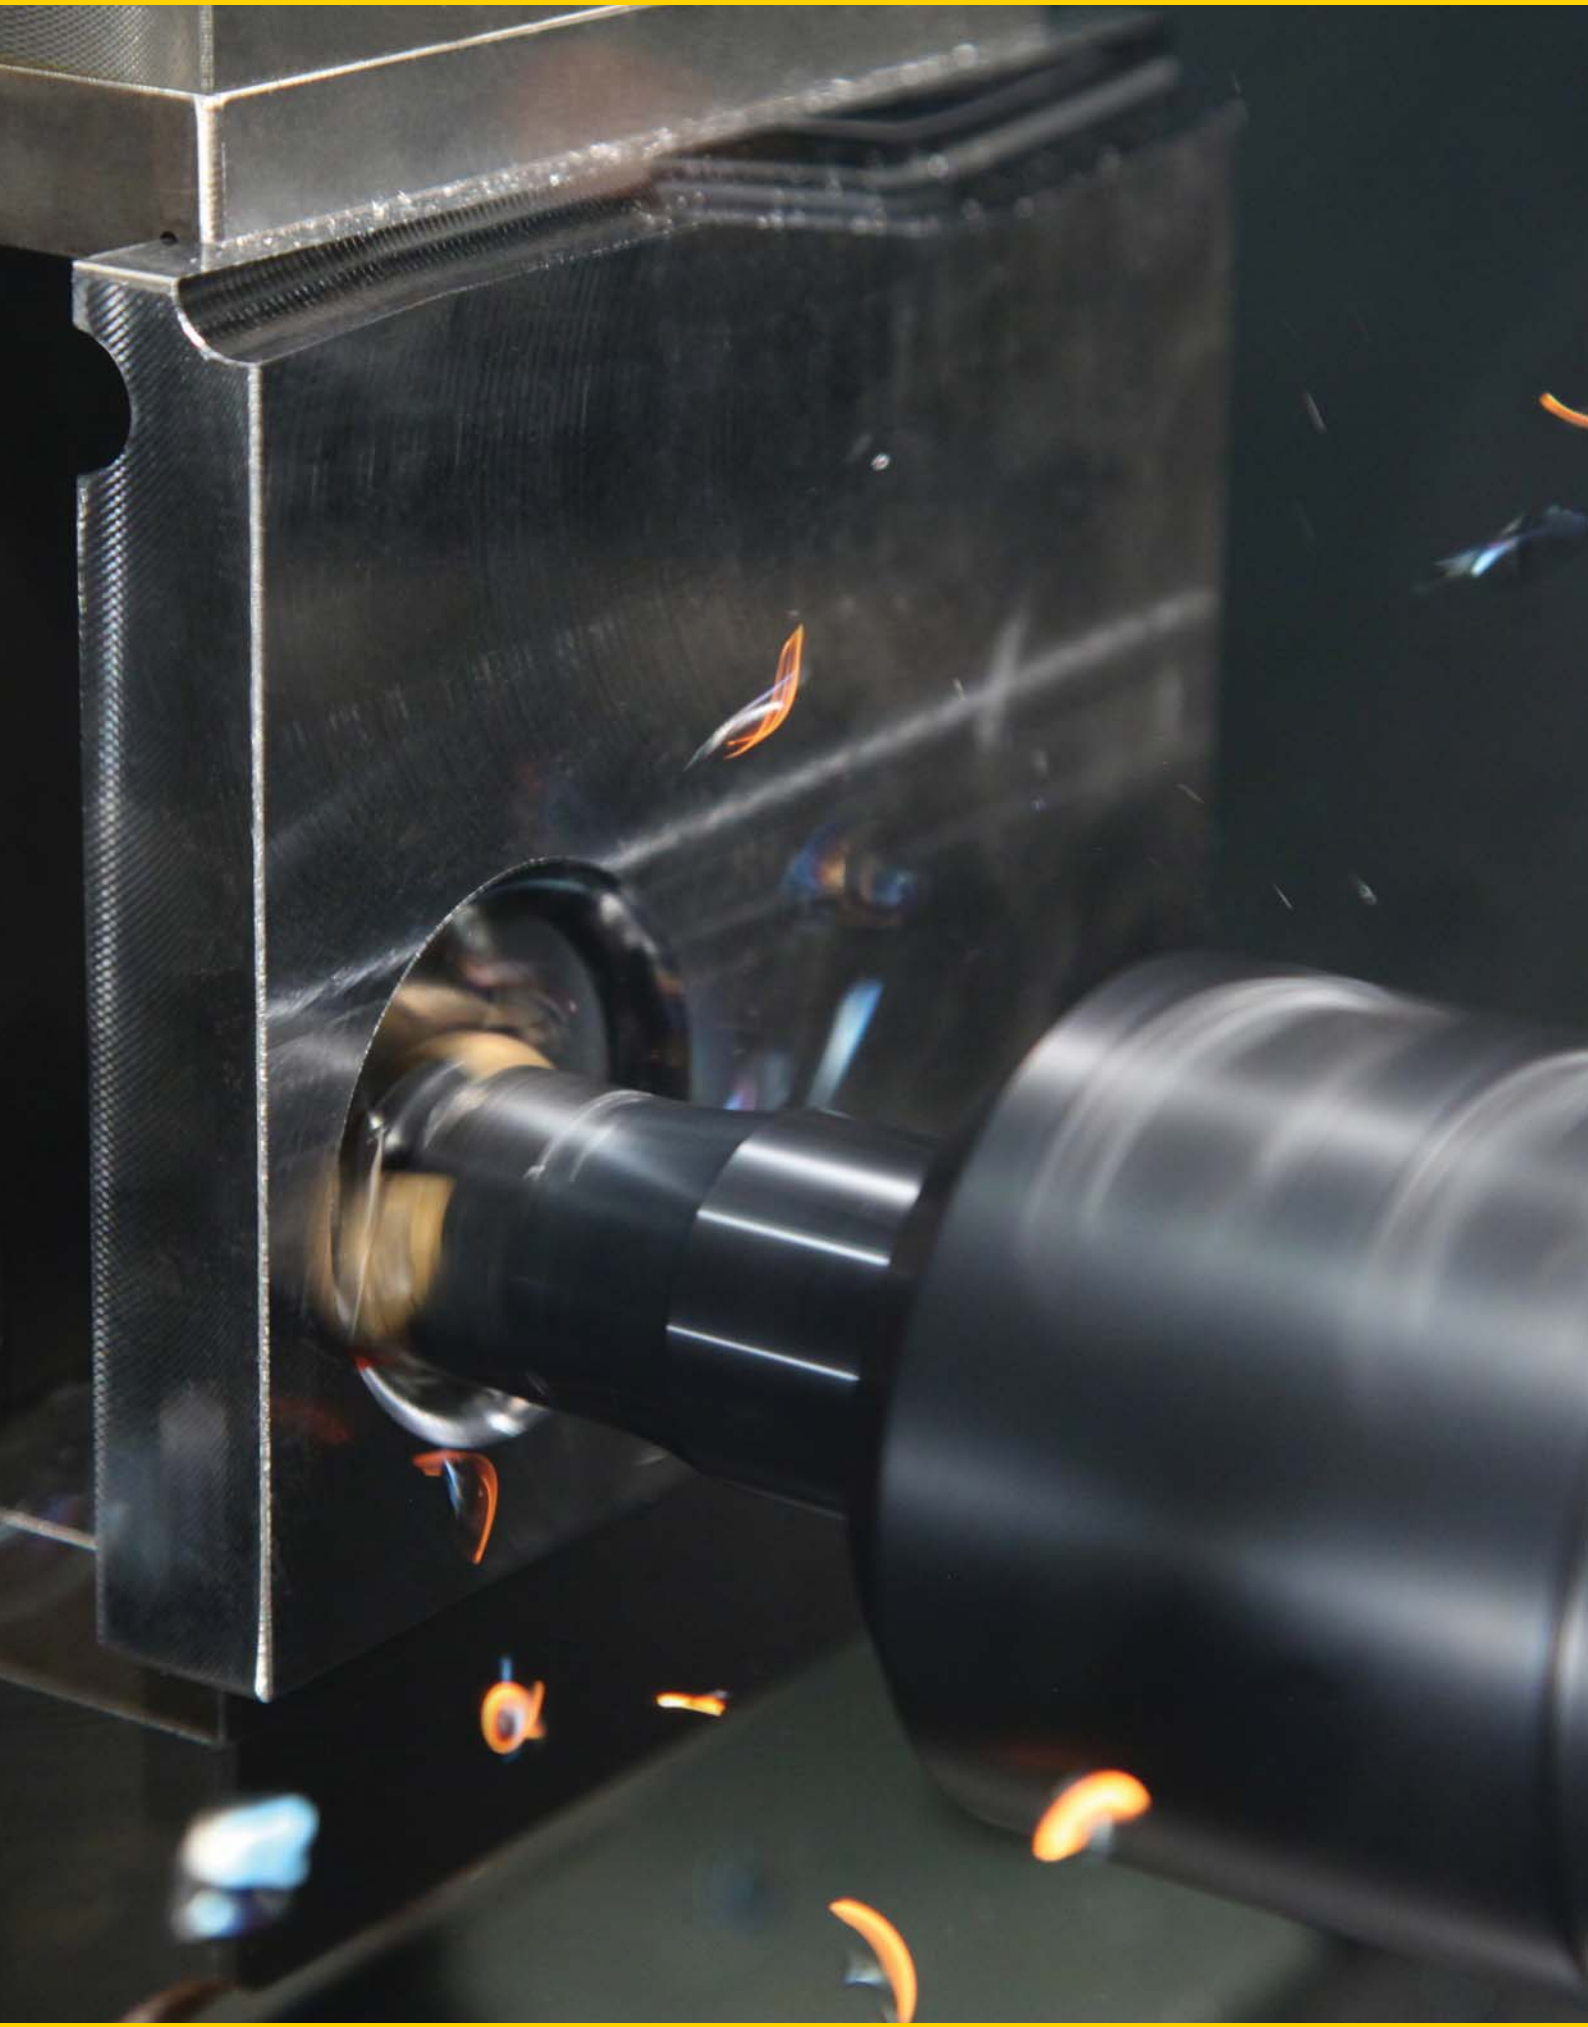
KSSM Slot Width Adjustment Instructions



1. Measure body width at pocket 1 (per stamp on tool body) behind cartridge.
2. Zero tool presetter at pocket 1 behind cartridge.
3. Move presetter over the insert and set distance Y. Y= (Desired Slot Width-Body Width)/2
4. Zero over insert at starting pocket (pocket 1).
5. Adjust remaining cartridges on the same side.
6. Return to starting pocket and start with step 2 for opposite side of cutter.

KSSM Cartridge Adjustment Instructions

1. Insert 3mm hex wrench into STCM Screw.
2. Rotate 3mm hex wrench anti-clockwise to loosen wedge.
3. Rotate 3mm hex wrench clockwise to lightly tighten STCM screw to approximately 1 Nm, so the wedge is touching the cartridge and cutterbody. This creates some slight resistance against the cartridge during the adjustment.
4. Insert hex wrench into cam pin behind cartridge.
5. Rotate wrench to adjust cartridge to desired position.
6. For best accuracy, back cam pin off, so you can feel it is not touching the sides of the slot in the back of the cartridge.
7. Remove wrench from cam pin.
8. Insert 3mm hex wrench into STCM screw.
9. Tighten STCM screw to 5,1–6,2 Nm prior to using the cutter. Kennametal torque wrench KTW45 or alternate torque wrench should be used.
10. Double check cartridge position to assure no movement.

Stellram® 7792 High-Feed Series

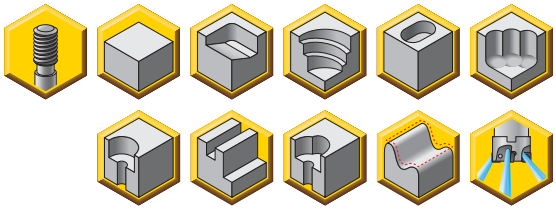
Indexable Milling

The 7792 cutter series has been designed for high-feed milling applications with superior surface generation. 7792VX cutters are designed for a wide range of applications, including facing, pocketing, ramping, helical interpolation, and plunging. They are capable of machining all materials, including steel, stainless steel, cast iron, and high-temperature and aluminium alloys.

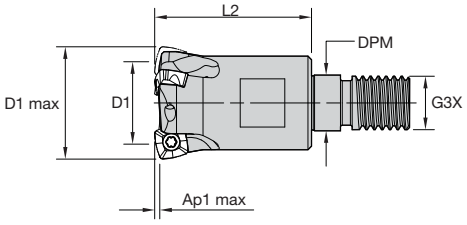
Features and Benefits

- The 7792VX high-feed cutters are the best solution for reducing cycle times or removing the maximum amount of material in the shortest time.
- New ultra-fine pitch cutters further increase metal removal rates, especially in high-temp alloys.
- The unique design and insert positioning help to achieve up to 5x higher feed rates than other cutters on the market.
- When used in long (extended) toolholders, 7792VX cutters absorb vibrations and greatly reduce instability and tool deflection.
- Integrated wiper facet for improved surface finish: 16 Ra (1,6µ) when used at <0,5 mm/z.

7792VXP06:
Maximum ap = 0,90mm
Diameter Range = 16–35mm



7792VXD09:
Maximum ap = 1,50mm
Diameter Range = 25–66mm



7792VXD12:
Maximum ap = 2,50mm
Diameter Range = 32–160mm

7792VXE16:
Maximum ap = 3,50mm
Diameter Range = 40–160mm

NOTE: Larger diameter shell mill fixation cutters with interchangeable cartridges are available.

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.
- Screw-on cutters provide better rigidity and stability when used with small spindels: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.

Ramp angle A uses one outside cutting edge only.

A = max ramp angle utilising full face contact.

NOTE: For further details about using the 7792VX series in plunging operations, please see page V33.
Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.
- Screw-on cutters provide better rigidity and stability when used with small spindels: BT30, BT40, DV40, HSK50, HSK63, etc.
- Screw-on cutters can be less expensive when compared to cylindrical shank cutters due to their higher flexibility through multiple holder combinations.

NOTE: For further details about using the 7792VX series in plunging operations, please see page V33.
Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Ultra-fine pitch cutters available to increase material removal rates, especially on high-temp alloys.
- Positive design to support lower cutting forces and long overhang usage.
- Ramping and plunge milling capabilities.

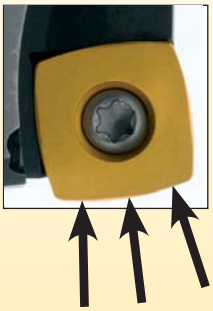
Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Plunging

The cutting edge should not be in contact with the material face after machining to maintain the cutting edge quality.

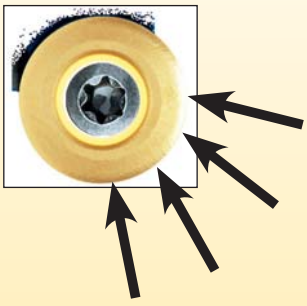
The scallop height is calculated in relation to the step over.



The maximum radial engagement is directly in relation to insert cutting edge length.

For insert type:
XP…06 the ae, max is 3mm.
XD…09 the ae, max is 6mm.
XD…12 the ae, max is 9mm.
XE…16 the ae, max is 13mm.

The advantages of face milling and producing cavities with the Stellram® high-feed face mill are numerous.
The unique design of the insert, approach angle, and the cutter body ensure the cutting forces are predominantly directed in the axial direction.
The example shown with a round insert tool shows complex forces which result in high levels of vibration and damage to the cutting edge.



7792VX

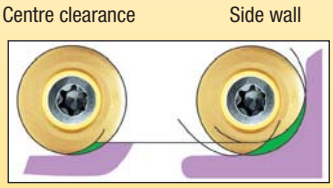
- Cutting forces predominantly axial.
- Relationship between cutting edge and workpiece is at its most stable.
- Results in high feed rates and consistent tool life.

Round Insert Tools

- Tangential forces act around the radius.
- Leads to vibration and damage of the cutting edge.
- Leads to reduced feed and lower productivity.

The 7792VX machines with a constant volume of chip throughout all aspects of producing cavities and produces a side wall that is close to profile.

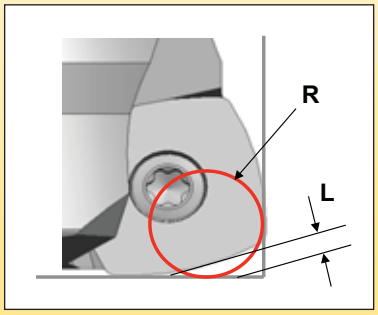
7792VX



- Constant cutting section (chip volume) irrespective of position in cavity.
- Producing a close to profile side wall.
- Near-square side walls possible.

Round insert tools have increasing chip volume through the process.

Round insert

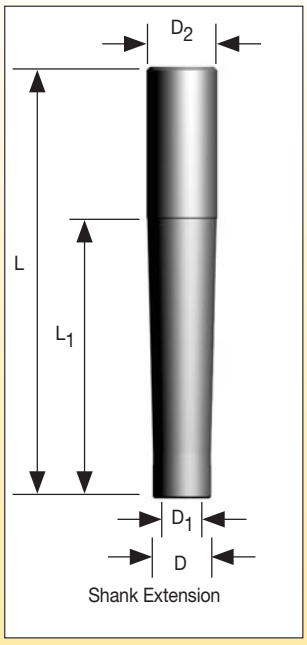


- Greater surface contact.
- Increased chip section for side wall machining.
- Vibration in corners.
- Undulating side wall cusps.

CNC Programme • Corner Radius Definition

The use of common CAD/CAM systems requires a round insert dimension to be known for cavity machining. This is available with 7792VX cutters as shown below and in the reference table.

For finish pass applications:
Wiper Facet for finishing use max feed 0,5 mm/z



Programming Data (mm)			
Insert corner nose size (IC)	Rε	R	L
06	0,80	1,37	0,40
09	0,80	2,01	0,73
	1,20	2,27	0,67
12	0,80	2,50	1,02
	1,20	2,73	0,97

NOTE: Order example with cylindrical shank: M-13-M8-CA.625-3.543.

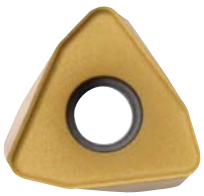
Shank Extension

Cylindrical shank extensions can be used with all modular heads found in several product family series within this catalogue.

These extensions have the industry standard of metric threads.

Technical Advice

M	Modular adaptor
13	Diameter in front of the modular shank (D) = 13mm
M8	Metric Thread (M)
CA16	Cylindrical shank diameter 16mm with through coolant
90	Total length of the body

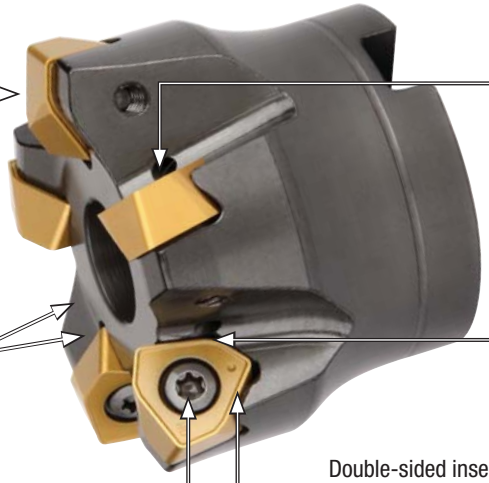


KenFeed™ 2X Series

Primary Application

KenFeed 2X is a double-sided trigon insert with six cutting edges engineered to provide superior metal removal and productivity through high feed rates in roughing operations. Smaller depths of cut at extremely high feed rates result in lower cutting forces, reducing vibrations and increasing process reliability.

Features and Benefits



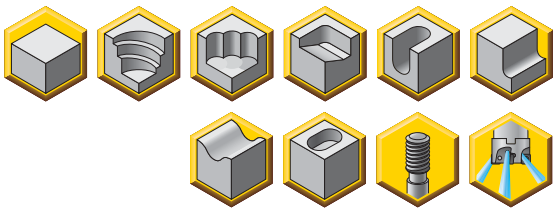
- Six cutting edges per insert. Double-sided solution with unique design.
- Two different topography styles cover any type of material, component, and application.
- KenFeed 2X inserts are specially suitable for long, deep applications, up to 10 x L/D ratio.

9mm IC Insert WOEJ094....
Up to 1,5mm Ap max.
Diameter 25–80mm

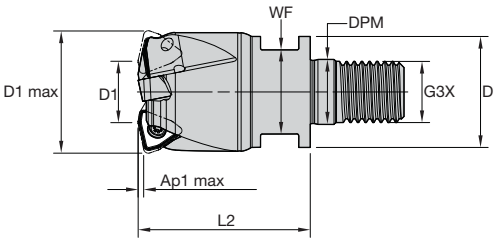
The ultimate and innovative concept for applying the latest high-feed milling strategies.

Strong design with a thick insert provides outstanding reliability.

Screw-on, end mill, and shell mill cutters with internal coolant.



Platform designed for pocketing, ramping, and helical interpolations.



Just two topographies to cover all applications with easy selection.

Double-sided insert with six cutting edges for better cost-per-edge position with full usage.

No need for additional clamping device. Screw provides easy handling.

- Dramatically improves MRR using the latest milling strategies.
- Engineered to run up to 2,5mm fz.
- Ideal for pocketing, ramping, and helical interpolations. Z-plunge capabilities.
- First choice for deep cavities or from 3 x D.

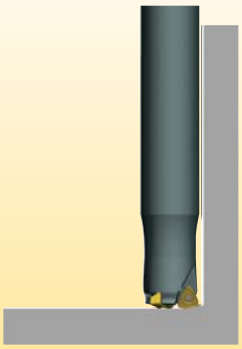
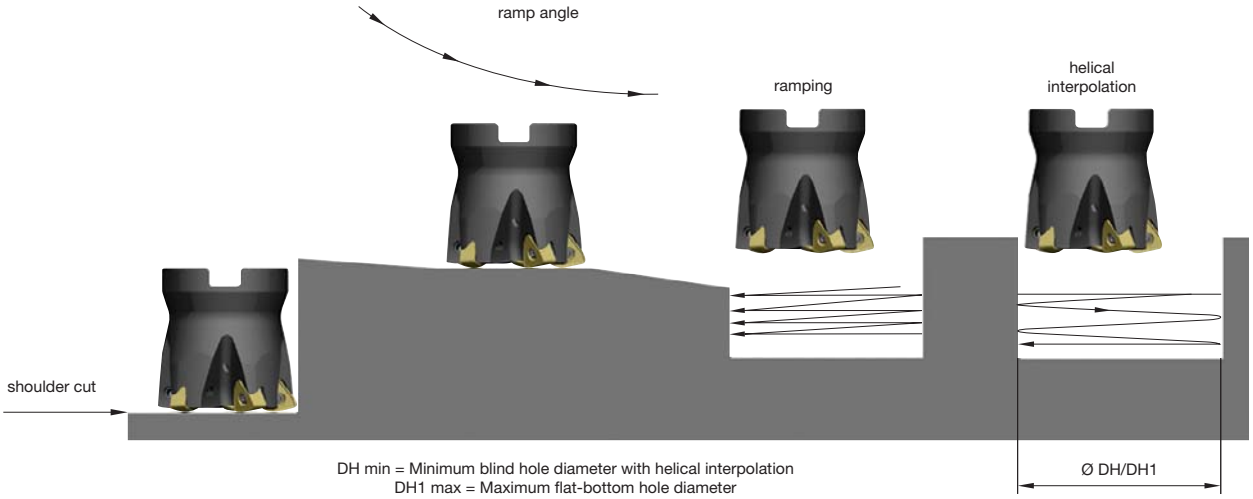
General Programming Information for Applying KenFeed 2X • IC09



Rt	Wt	t
2.70	8.15	1.15

Small Ap1 values and higher feed rates generate lower cutting forces versus traditional milling strategies.



For CAM programming, the loads can be programmed as a toroidal tool type by using the Rt value as the insert radius.

Recommended when long overhang is necessary due to lower radial forces. Maximum L/D ratio of 10 x D.

Rodeka™ Inserts

The New Round Insert Generation

Primary Application

Kennametal introduces a revolutionary double-sided round milling insert capable of running in multiple types of milling operations and workpiece materials. The Rodeka series provides the latest double-sided insert technology to boost your productivity with the most efficient cost per edge.

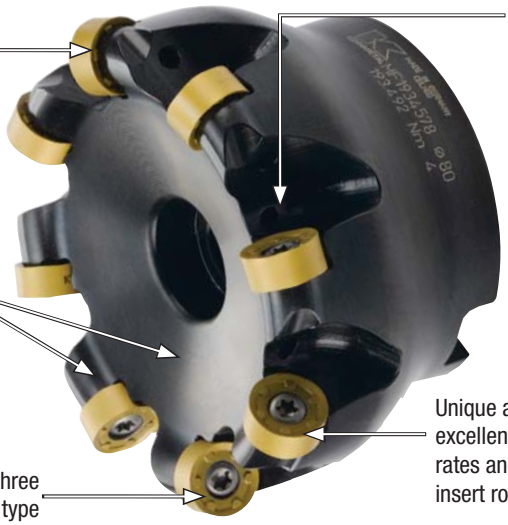
Features and Benefits

Rodeka Double-Sided Round Inserts

- Three insert sizes: 10, 12, and 16mm.
- Innovative, cutting-edge design increases tool life and reduces cutting forces.
- Rodeka 12X series is a tailor-made solution for turbine blade machining.

Rodeka 10
10mm IC insert
8 cutting edges

Rodeka 12X
12mm IC insert
8 cutting edges

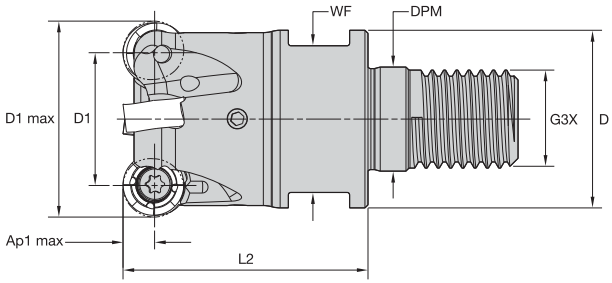


Rodeka 12
12mm IC insert
12 cutting edges

Rodeka 16
16mm IC insert
12 cutting edges

Double-sided insert with up to 12 cutting edges for a more productive cutting process.

Screw-on, end mill, and shell mill cutters with internal coolant.



Higher clearance in bodies to permit pocketing, profiling, and 5-axis machining.

Unique anti-rotation feature for excellent stability with higher feed rates and cutting forces. User-friendly insert rotation.

Three different insert sizes and three topography styles per size cover any type of material, component, and application.

- Double-sided round inserts with eight indexable positions.
- Anti-rotation features enable higher cutting data and extra stability.
- Pocketing and profiling capabilities.

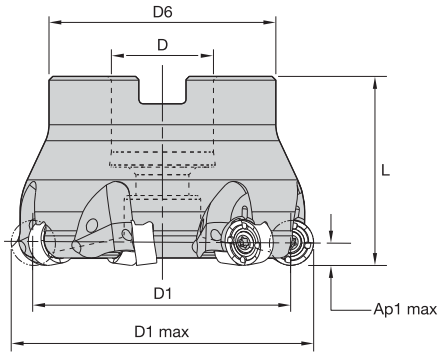
Rodeka 12X Turbine Blade Version



Revolutionary double-sided round insert engineered for turbine blade machining. Special geometries, insert styles, and dedicated cutter bodies have been developed to serve this demanding application.

- Double-sided round inserts with eight indexable positions.
- Anti-rotation features enable higher cutting data and extra stability.
- Engineered for turbine blade machining.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Mobile App

The Kennametal mobile app makes it easy to access product information, calculators, and much more from iPhone® and Android™ devices.

FEATURES

Scan a Kennametal tool package barcode or search a product catalog number to access complete product information.

Product information includes tool image, dimensions, grades, and product highlights.

View product availability at global locations.

Get speed and feed information in inch and metric values for all metalcutting products.

View tech tips for helpful solutions to common machining questions.

Contact Customer Support directly from the app.

MACHINING CALCULATORS

View data for milling and drilling applications.

Inch and metric values calculated.

ORDERING

Login using your Konnect credentials to complete a purchase.

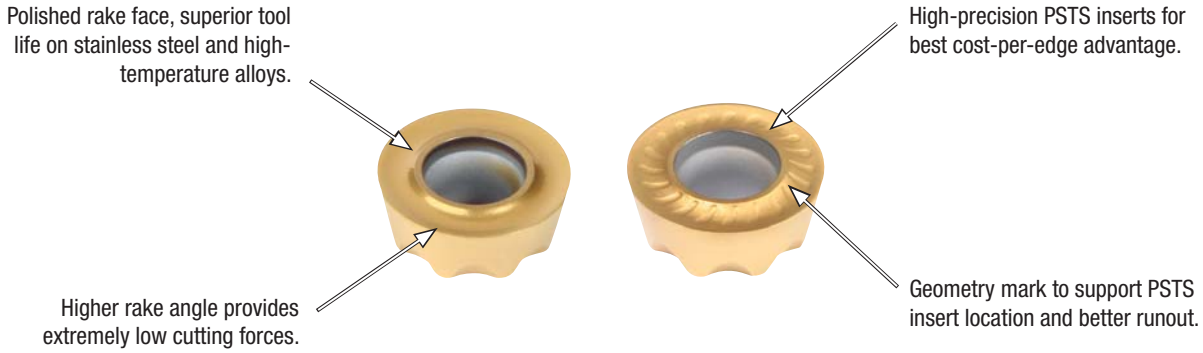
WHERE TO FIND IT

Download the free app today from iTunes® or the Google Play™ store.

ANDROID APP ON Google play

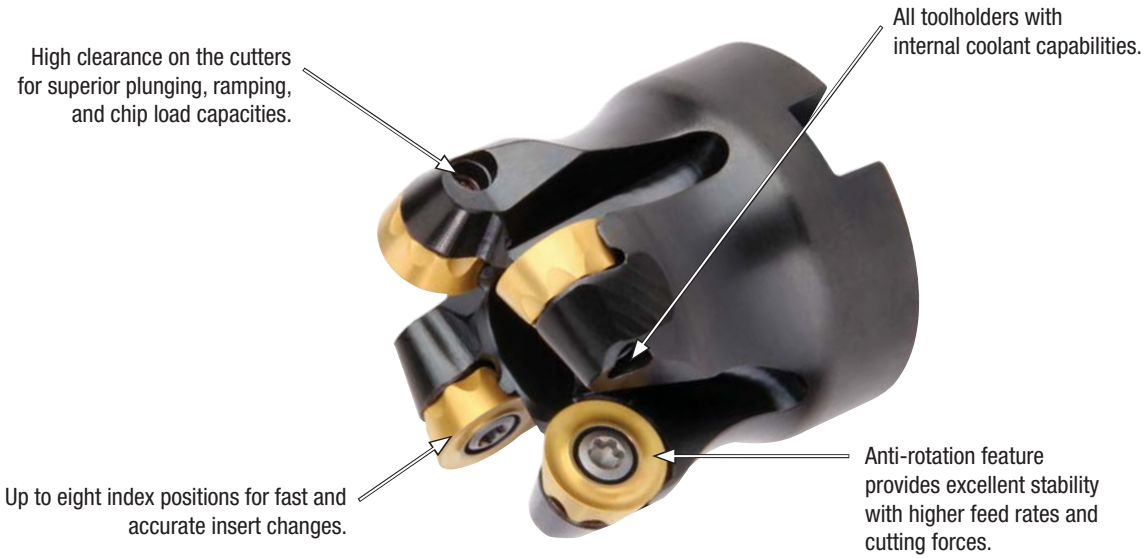
Available on the App Store

KSRM™ Series



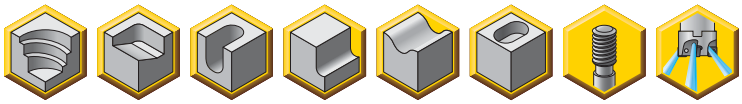
Multipurpose Milling Cutters • 12mm, 16mm, and 20mm ICs

Primary Application

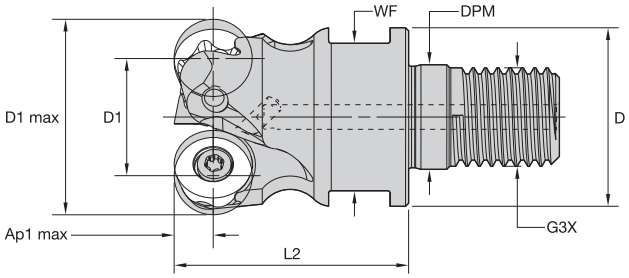


Specially developed for machining titanium and stainless steel. KSRM platform enables you to pocket, profile, ramp, and plunge with consistent performance and outstanding metal removal rates with the lowest cutting forces.

Features and Benefits



- Up to eight cutting edges per insert.
- Anti-rotation feature achieves excellent stability.
- Engineered to provide longer tool life in titanium and stainless steel.
- Roughing and semi-finishing operations with lower cutting forces.



High clearance on the cutters for superior plunging, ramping, and chip load capacities.
All toolholders with internal coolant capabilities.
Up to eight index positions for fast and accurate insert changes.
Anti-rotation feature provides excellent stability with higher feed rates and cutting forces.

- Engineered for titanium and stainless steel machining.
- Anti-rotation components feature eight indexable positions.
- Pocketing, ramping, plunging, and helical interpolation capabilities.

- Diameter range from 63–200mm.
- Engineered for roughing titanium with large depths of cut through positive geometry inserts.
- Anti-rotation feature allows up to six indexable rotations.
- High coolant pressure capabilities.

NOTE: For high pressure coolant applications (>30 bar/>435 PSI) with cutter diameter 160-200mm, use items marked with “HP” in the catalogue number. They are available as per request. Please ask your local sales contact for further information.
*Made-to-order standard item. Standard pricing, manufacturing lead time, and minimum order quantity applies.

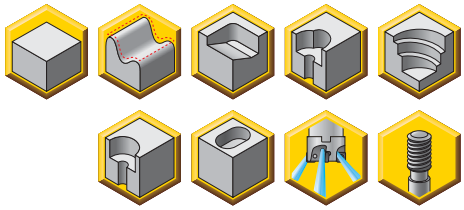
7713VR Series

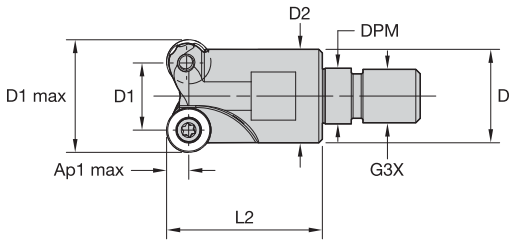
Round Insert Milling Cutter with Indexation

The 7713VR is our newest round insert cutter series. Designed with a new silver-satin surface treatment that reduces body degradation during high-performance applications and enhances body tool life. This cutter series has an anti-rotation design that ensures a precise number of indexes per insert. This enables maximum usage of the available edges for roughing applications.

Features and Benefits



This unique patented pocket system prevents the inserts from rotating in the pocket during heavy-feed machining and unstable conditions. The 7713VR cutter is excellent for roughing and semi-finishing of all materials, especially stainless steel and high-temperature alloys, as well as steel, tool steel, and aluminium alloys.



7713VR10:
Maximum ap = 5mm
Diameter Range = 20–63mm

7713VR12:
Maximum ap = 6mm
Diameter Range = 25–80mm

- Turbine blade machining and copy/contour milling applications.
- Patented locking system prevents insert rotation during heavy machining.
- Positive flute design for excellent chip evacuation.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

- Turbine blade machining and copy/contour milling applications.
- Patented locking system prevents insert rotation during heavy machining.
- Positive flute design for excellent chip evacuation.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

7713VR Technical Information

Working Diameter:

Formula to evaluate the correct working diameter based on axial depth of cut (ap).

$$D_w = D_2 + 2 \times \sqrt{r^2 - (r - a_p)^2}$$

where:

D_w = Working diameter
D_2 = Diameter of cutter insert centre to centre
r = Insert radius
a_p = Axial depth of cut

where:

f_z = Feed per tooth
h_m = Average chip thickness
r = Insert radius
a_e = Radial depth of cut
a_p = Axial depth of cut

Formula to find programmed feed rate based on radial engagement and axial depth of cut.

$$f_z = \frac{h_m}{\frac{\sqrt{r^2-(r-a_e)^2}}{r} \times \frac{\sqrt{r^2-(r-a_p)^2}}{r}}$$

Formula to calculate the average chip thickness hm in relation with radial engagement and depth of cut.

$$h_m = f_z \times \frac{\sqrt{r^2-(r-a_e)^2}}{r} \times \frac{\sqrt{r^2-(r-a_p)^2}}{r}$$

Simplified formulas to evaluate h_m and f_z based on radial engagement or depth of cut.

Calculation of the average chip thickness in relation with the D.O.C. (Axial)

Formula: Programme Feed Rate (f_z)

$$f_z = h_m \times \sqrt{\frac{d}{a_p}}$$

h_m = Average chip thickness
a_p = Depth of cut
f_z = Feed per tooth
d = Insert diameter

Formula: Average Chip Thickness (h_m)

$$h_m = f_z \times \sqrt{\frac{a_e}{d}}$$

Calculation of the average chip thickness in relation with the a_e (Radial Engagement) if a_e is less than 50% of diameter

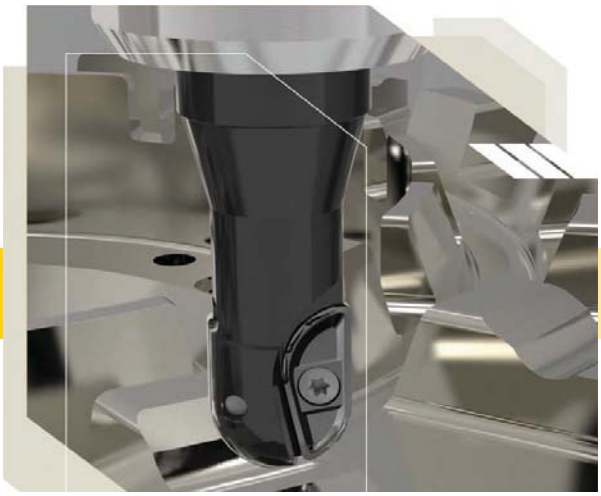
Formula: Programme Feed Rate (f_z)

$$f_z = h_m \times \sqrt{\frac{d}{a_e}}$$

h_m = Average chip thickness
a_e = Radial engagement
f_z = Feed per tooth
d = Cutter diameter

Formula: Average Chip Thickness (h_m)

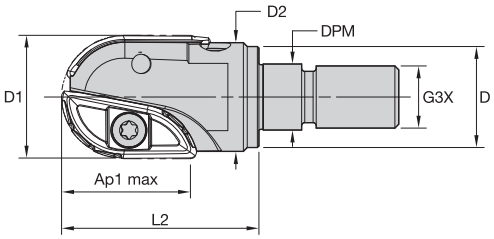
$$h_m = f_z \times \sqrt{\frac{d}{a_p}}$$



5505VX Series

Copy/3D

Contour Milling



Ball Nose Contour Milling Cutter

- The 5505VX ball nose cutters have a reinforced design feature, which delivers a high volume of chip removal.
- The chipbreaker geometry provides excellent chip control and evacuation during machining and prevents edge build-up.
- 5505VX roughing ball nose cutters are ideal for roughing and semi-finishing profiles and complex contours.
- One grade and one geometry are qualified to machine steel, alloyed steel, stainless steel, high-temperature alloys, and cast iron.

- Rough to semi-finish profiling and contour milling.
- Helical insert design for increased speeds and feeds.
- One insert geometry covers most materials for optimised inventory.

Service and Support

Customer Application Support (CAS)

Get Fast and Reliable Answers to Your Toughest Metalcutting Problems

Our Customer Application Support (CAS) Team is the metalworking industry's leading help desk resource for tooling application solutions and problem resolution.

Easy Access to Proven Metalworking Expertise!

Kennametal Customer Application Engineers assist customers and engineering groups throughout the world with expert tool selection and application recommendations for the entire range of Kennametal tooling.

SERVICE LEVEL EXCELLENCE	Fast telephone response. Quick technical solutions. Efficient case management.
SERVICES	Operating parameters. Process optimisation. Hardware support. Tooling selection. Troubleshooting.
BEST-IN-CLASS SUPPORT TOOLS AND TECHNOLOGY	Materials database. Application calculators. Tooling performance experts.

Indexable Copy Insert Platform

Primary Application

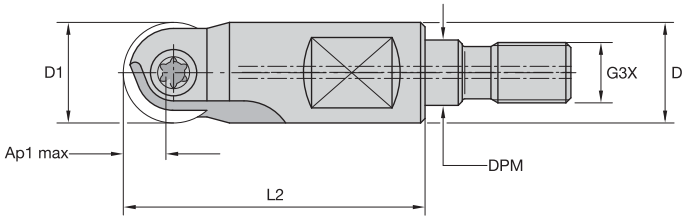
Ball nose and toroidal styles for roughing and finishing operations. Engineered with the ultimate technologies and supported with a wide range of diameters and insert styles to provide exceptional performance and productivity. The new high-feed insert style provides the highest metal removal rates for roughing applications.

Features and Benefits

Longer Tool Life and Improved Geometries

- Longer tool life for finishing operations, up to 63 HRC.
- High-accuracy inserts and holders: overall runout ± 0,01mm.
- Improved geometries for roughing and finishing operations.
- Smaller diameters from 6mm to replace SCEM, setting a more productive machining process.

Superior Productivity



- Achieve better surface quality with the new helical geometry.
- New ultra-grain grade for outstanding tool life.
- Diameters 6mm and 8mm are a natural replacement for SEM tools.
- Better cost per edge.

Usability and Flexibility

- Wide diameter range, from 6–32mm, use in a wide range of machining conditions.
- Many workpiece materials are possible — from hardened steel to aluminium.
- Large holder style offering: screw-on, cylindrical, and tapered steel and carbide holders.

- Available diameters: 12–25mm.
- High precision and runout accuracy.
- Suitable for roughing and finishing operations.

- Cutting diameter ranges from 12–32mm.
- Ball nose finishers for 3D milling applications.
- Suitable for roughing and finishing operations.
- High precision and runout accuracy.
- Can be used with heat shrink technology, h6 shank tolerance.

- Available diameters: 8–25mm.
- Ball nose finishers for 3D milling applications.
- Suitable for roughing and finishing operations.
- Tapered version ideal for 5-axis applications.
- High precision and runout accuracy.
- Can be used with heat shrink technology, h6 shank tolerance.

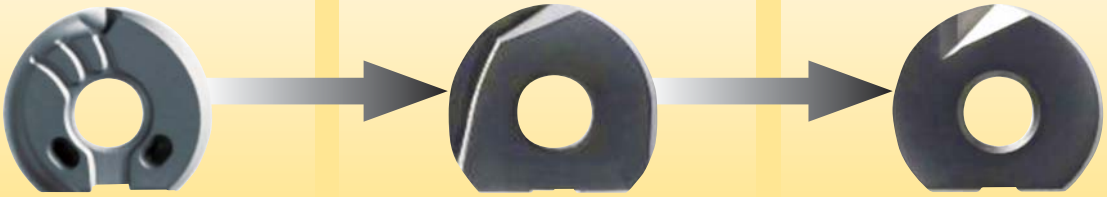
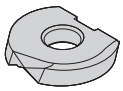
Insert Style

HC Geometry:

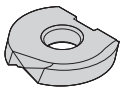


PSTS geometry with chipbreaker for roughing. Semi-finishing and rest material of steel, cast steel, and high-temperature alloys.

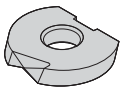
GP Geometry:



High-precision insert with helical geometry for semi-finishing and finishing of steel up to 63 HRC, cast steel, and high-temperature alloys.



GN Geometry:



Geometry with extremely solid cutting edge for roughing cast steel, high-temperature alloys, and hardened steel up to 60 HRC.

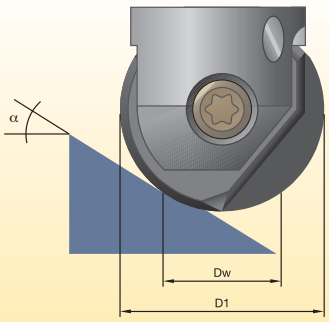
NOTE: Working diameter (Dw) or effective diameter has to be considered when calculating appropriate RPM.

Calculating Working Diameter and Resulting Surface Speed

Case 1:



It is important to consider the effective diameter (Dw) when using light depths of cut in order to properly calculate RPM values. Use the following formula when machining flat surfaces or inclinations of 10° or less to find the Dw value. Then, use this for RPM calculations, as opposed to using the overall insert diameter (D1).

$$Dw = \sqrt{D1^2-(D1-2Ap1)^2}$$

Case 2:

When machining inclinations between 11° and 55°, further modification of vc is required. Apply factor "k" from the given formula to calculate the correct vc (vceff). This corrected value is then used to calculate the proper RPM for the tool.

$$k = \frac{1}{\sin[\alpha + \arccos(1-(2(Ap1/D1)))]}$$

$$vceff = vc \times k$$

Please see pages X22–X37 for recommended starting speeds.

- Available diameters: 12–20mm.
- High precision and runout accuracy.
- Suitable for roughing and finishing operations.
- Works with toroidal and high-feed inserts.

- Available diameters: 12–25mm.
- High precision and runout accuracy.
- Can be used with the heat shrink technology, h6 shank tolerance.
- Suitable for roughing and finishing operations.
- Works with toroidal and high-feed inserts.

- Suitable for roughing and finishing operations.
- High precision and runout accuracy.
- Can be used with the heat shrink technology, h6 shank tolerance.
- Works with toroidal and high-feed inserts.
- Available diameters: 10–20mm.

NOTE: Use “Light Machining” values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Application Advice for KDMT-HF Insert Style

For CAM programming, the tools can be programmed as a toroidal tool type requiring the diameter and the RT values only.

insert type	metric			
	Ap max	diameter	RT	max fz
KDMT0604SRHF	0,4	6	0,8	1
KDMT0806SRHF	0,5	8	1	1,3
KDMT1008SRHF	0,5	10	1	1,3
KDMT1210SRHF	0,6	12	1	1,3
KDMT1615SRHF	0,8	16	1,5	1,5
KDMT2020SRHF	1	20	2	1,5

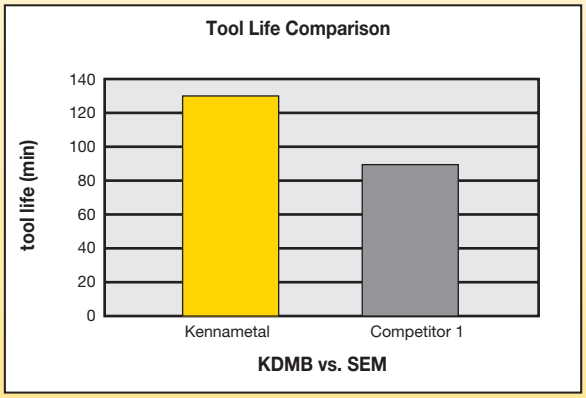
Data for Face Milling, Pocketing, and Profiling Operations

Starting Values

tool diameter	Ø6	Ø8	Ø10	Ø12	Ø16	Ø20
Ap max (mm)	0,4	0,5	0,5	0,6	0,8	1
fz recommended for 45 HRC (approximately)	0,4	0,45	0,45	0,5	0,55	0,65
fz recommended for 55 HRC (approximately)	0,3	0,35	0,35	0,4	0,5	0,55
fz recommended for general purpose	0,5	0,55	0,55	0,65	0,7	0,8

NOTE: Use two effective teeth for feed calculations.
For materials above 45 HRC, we recommend to adjust the Ae max to 55% of cutting diameter.
Steel shanks for roughing operations are recommended.

Proven Solutions:



KDMB™ Indexable Milling Cutter vs. Solid Carbide End Mills

1.

Workpiece:
Forging die
Material:
X38 CrMoV 5 3 (1.2367)
Size:
154mm x 115mm x 80mm
Machine:
Vertical milling machine centre

Kennametal
Tool: KDMB06R100A06HN
Insert: KDMB06M0ERGN KC505M
Competitor 1
Solid Carbide End Mill
Ø 6 R3

Cutting data:
vc = 250 m/min (825 SFM)
Ap = 0,28mm (.099")
ae = 1,32mm (.052")
fz = 0,131mm (.0052")

Superior Productivity:
Higher tool life and cost per piece

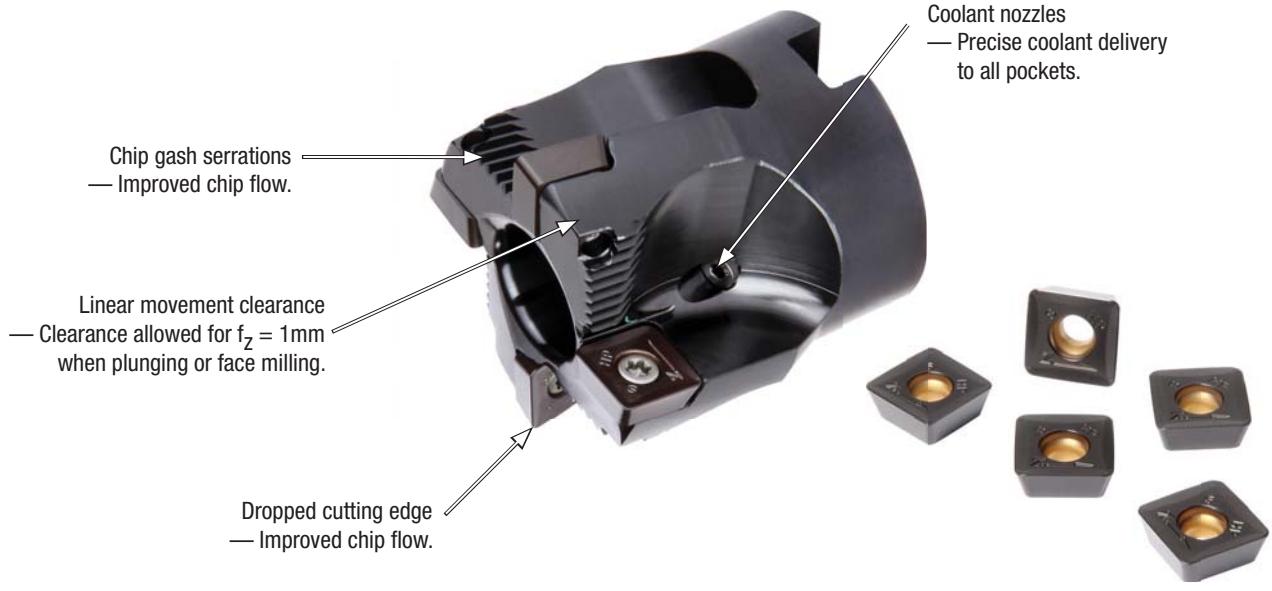
2.

Workpiece:
Pressing die component
Material:
1.2479 (D2)
Size:
410mm x 320mm x 210mm
Machine:
Vertical milling machine

Kennametal
Tool: KDMB06R100A06HN
Insert: KDMB06M0ERGP KC515M
Competitor 1
Solid Carbide End Mill
Ø 6 R3

Cost Performance Ratio:
Costs for diameter 6mm
MMC:
solid carbide end mill +
2 x regrinding
Reference: 100%
KMT:
3 x inserts +
3 x toolholder share:
Cost savings: 31.15%

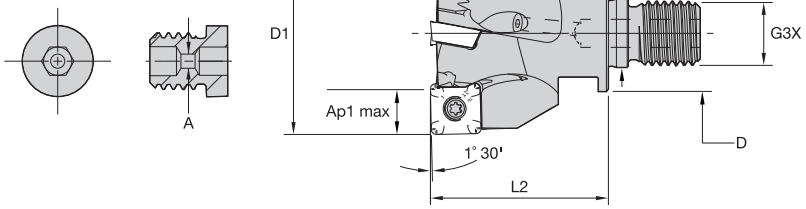
Z-Axis Plunge Mill



Primary Application

Specifically engineered to eliminate vibration and improve metal removal rates in roughing applications. Ideally suited for rough slotting applications in aerospace, general engineering, die and mould, and power generation.

Features and Benefits



Platform Features

- Nine coolant nozzle sizes enable customised flow by machine tool.
- Unique design is unmatched for chip evacuation.
- Improved performance at a reduced cost per cutting edge.
- Positive geometry lowers cutting force and reduces power requirements, enabling higher feed rates.
- Improved chip control when slotting.
- Fast and easy insert indexing.

- Most stable cutting due to force directions.
- Excellent for long reach applications.
- Extended tool life.
- Suitable for a wide variety of workpiece materials.
- Up to 11mm stepover.
- Unique coolant delivery.
- Chip control when slotting.

Coolant Nozzle Key

order number	catalogue number	drive size
1993552	**THW2M**	2 MM

NOTE: Check the spare parts table for the coolant hole size that is incorporated in the cutters.
If you need an alternative, there are eight other variants to choose from to increase or decrease the pressure.
Example: MS2191C12 is a 1,20mm hole. All coolant nozzles are interchangeable with the original that is supplied with the cutter, which gives flexibility with coolant flow.

- Most stable cutting due to force directions.
- Excellent for long reach applications.
- Extended tool life.
- Suitable for a wide variety of workpiece materials.
- Up to 11mm stepover.
- Unique coolant delivery.
- Chip control when slotting.

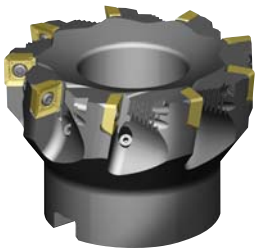
Coolant Screw Detail



order number	catalogue number	A
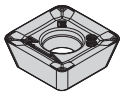
3400611	**MS2191C00**	—
3400612	**MS2191C06**	0,600
3400613	**MS2191C08**	0,800
3400616	**MS2191C12**	1,200
3400617	**MS2191C14**	1,400
3400618	**MS2191C16**	1,600
3400619	**MS2191C18**	1,800
3400620	**MS2191C20**	2,000



NOTE: Check the spare parts table for the coolant hole size that is incorporated in the cutters.
If you need an alternative, there are eight other variants to choose from to increase or decrease the pressure.
Example: MS2191C12 is a 1,20mm hole. All coolant nozzles are interchangeable with the original that is supplied with the cutter, which gives flexibility with coolant flow.

NOTE: Use "Light Machining" values as starting feed rate.
Please see pages X22–X37 for recommended starting speeds.

Z-Axis

Best Machining Practices

When finishing a workpiece, you sometimes have to use a Z-axis solution versus a conventional end mill solution to get the best results.

When the length-to-diameter ratio protrudes farther than 3:1, you will need to use a Z-axis solution. This is when the end mill starts to vibrate and the surface finish and noise are unacceptable.

When vibration occurs, the feed rates are compromised, which normally slows down the production of the workpiece.

Programming

At this point, there is very little software for this type of application on the market. We suggest that a simple macro is created for this type of application, which can be recalled and the “X” and “Y” movement changed.

The process can be repeated, so the cutter can be removed from the workpiece in the rapid (G00) movement. Tool life will be improved by not allowing the insert to rub on the retract path.

Slotting

There are several differing ways to machine a slot in a component using the Z-axis cutter solution.

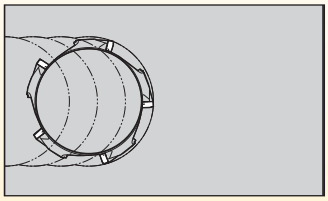

Figure 1

This shows the typical way of machining a slot. The movements are feeding down and straight back up (Z+) in the same axis and will have a negative impact on the insert radii (cutting edge) that could lead to premature failure of the nose radii. When looking at the component, it will show the rapid travel in the Z+ direction. This will highlight the spiral of the insert/cutter operating at a high feed. It looks similar to an oil groove spiralling upwards.

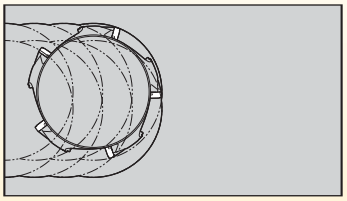

Figure 2

Using a cutter that is smaller than the slot width allows the insert/cutter to be removed from the material when (G00) rapid motion is retracting from the component. Because this type of cutter can be used across various types of machines, assume a 50mm (2.00") diameter cutter is being used to machine a slot of 63mm (2.50") wide on a vertical 3-axis machine.

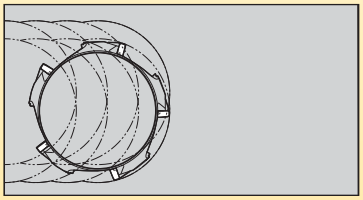

Figure 3

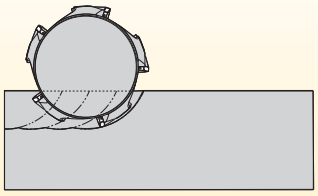
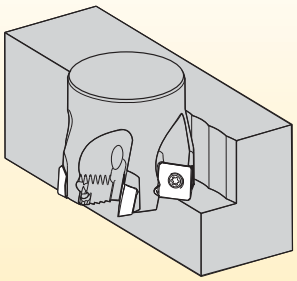
Align the cutter with the centre of the slot on the component and define the stepover that’s required. Move the Y-axis into a position for the first cut, take the first pass to a depth in the Z-axis, and when it reaches the bottom of the slot, programme a 2-axis move to retract the cutting edge for the workpiece.

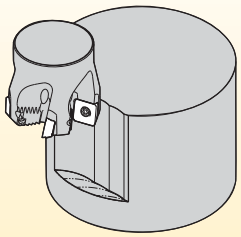
The 2-axis move will move the Z-axis in a positive direction at 45° (.010") away from the component, and the Y-axis will move away from the workpiece by the same amount at the same angle. Now the cutter can be retracted from the component, and the insert will not rub on the retract move.



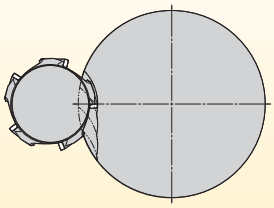
Move the cutter to the left of the slot to define the new position and make the cut. When reaching the base, a 3-axis move will need to be made. Again, the Z-axis will be in a positive direction at 45° (.010"), and the corresponding Y-axis will move away the same respective amount from the wall.



The insert/cutter has now moved away from the workpiece, and the rapid Z+ can take place. Repeat the process on the other side of the slot, remembering the X-axis move needs to be moving the other way.



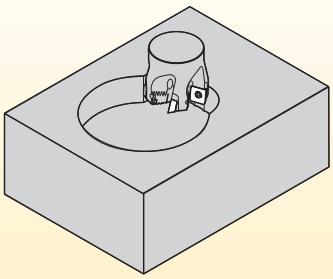
NOTE: When starting the process, it’s better to start at the centre of the slot. After the slot has been defined, you no longer need to put the cutter on the centre path. Passes from both sides create the slot width and enable clearance for the subsequent moves, so the insert/cutter can be moved away from the side walls of the material.



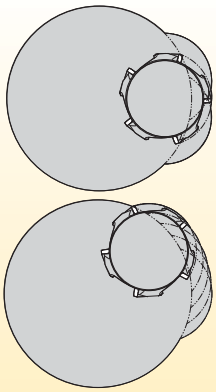
(continued)

Z-Axis *(continued)*

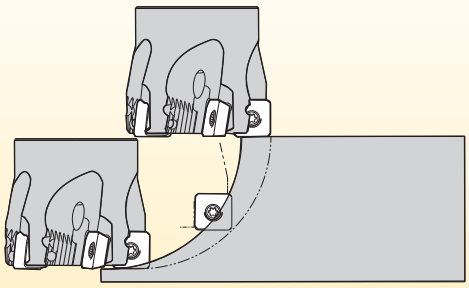
Linear Plunge Milling



Entering the cutter along a parallel axis, the radial width of cut needs to be defined because the cutter might need to move away from the workpiece material.



If the radial width of cut takes more than 60% of the cutter diameter, it is more difficult to remove the insert/cutter because the machine programme wants to move the cutter upwards to (G00) Z+. When taking more than 60% of the cutter diameter, the material is enveloping the cutter and is difficult to remove because a cusp has been created.



It is suggested to make the radial width of cut 50% of the cutter diameter to allow the insert/cutter to be removed without any problems.

External Profiling

This artwork represents the typical application for this type of process. Move into the cut and follow the external profile of the workpiece. When moving the cutter back to the start position, it's always advisable to move the insert from contacting the workpiece. This should be done with a 2- or 3-axis move (use .010") at 0,25mm. All axes moving in a Z+ direction will stop the rubbing in the retract move.

Internal Profiling

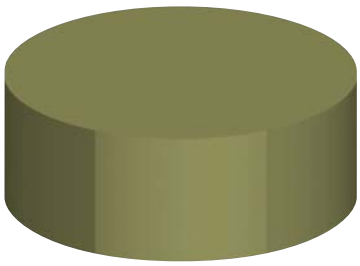
When taking the first pass of a depth, there is also a need to move the insert/cutter away from the material on the retract motion. Each of the passes that follow should adopt the same method on the retract move.

Follow the cutter path until the component has been finished.

Machining Around a Radii

This artwork shows the cutter taking a larger radial width of cut. When moving down in the Z-axis, the insert could start to take a larger radial width of cut. Typical application could be the manufacture of a turbine blade from a rectangular piece of material. Always remember that it's advisable to move the insert/cutter away from the material on the retract motion.

KCRA



Double-Sided Ceramic Round Insert

KCRA is our newest (patent pending) indexable milling ceramic round platform specifically engineered to maximise productivity while machining high-temperature alloys. Featuring double-sided inserts with increased tooth density, KCRA provides the highest Metal Removal Rate (MRR) with the most effective machining.

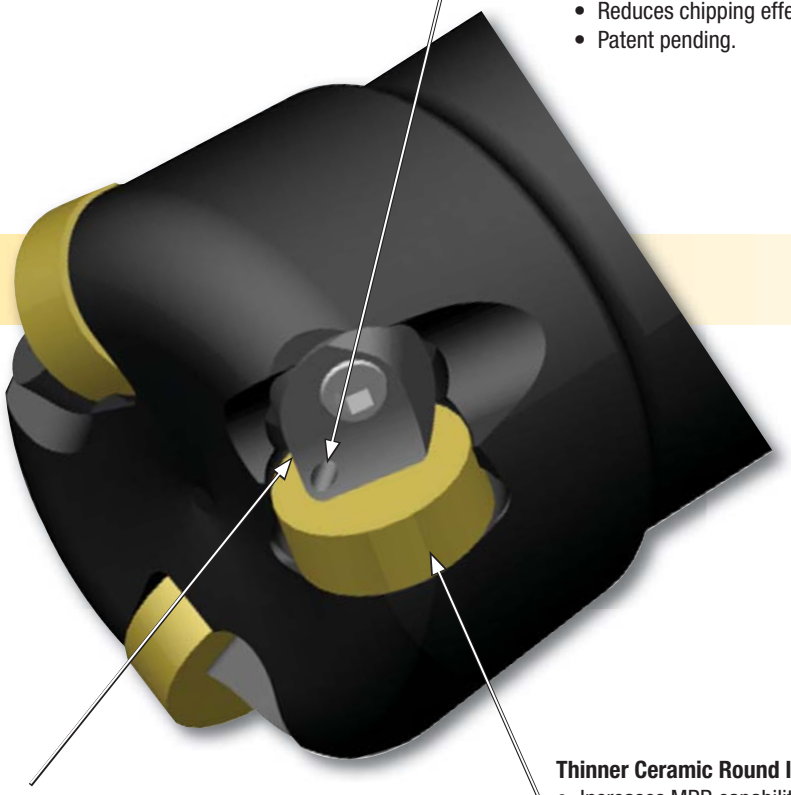
Kennametal ceramics dramatically increase your productivity when machining Ni- and Co-based alloys.

Features and Benefits

- First choice for face and shoulder milling of high-temperature alloys.
- Higher metal removal rate due to fine-pitch cutters.
- Secure clamping system improves process stability and reliability.
- Effective air coolant feature. Better chip flow and increased insert tool life.

Flat-top geometry for roughing applications in Ni- and Co-based alloys.

-EGN

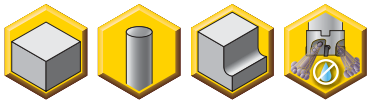


Lower cutting forces.

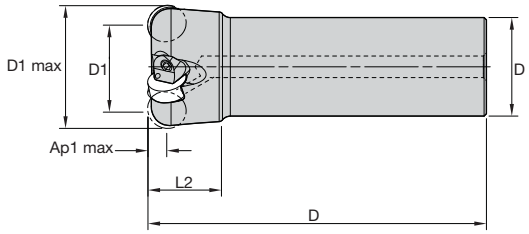
-TGN

Strongest cutting edge.

*Alternative for unstable situations.



Unique Air Coolant Feature
- Improves chip flow.
- Reduces chipping effect on cutting edges.
- Patent pending.



Secure Clamping System
- Improves stability.
- Increases process reliability.
- Facilitates insert change.

Thinner Ceramic Round Inserts
- Increases MRR capabilities.
- Reduces cutting forces.
- Improves cost per edge.

- First choice for face and shoulder milling high-temperature alloys.
- Higher material removal rate due to fine pitch cutters.
- Secure clamping system, improving process stability and reliability.
- Effective air coolant feature. Better chip flow and increased insert tool life.

Insert Assembly Guide

Safety Notes					
					
Read all instructions carefully	Wear eye protection	Inspect and tighten fasteners regularly	Warning: Cutting hazard	Warning: Hot surfaces	Do not exceed maximum RPM

Assembly Instructions	
1 Assemble STCM-25 screw to KW1008 wedge, 1 to 1 1/2 turns.	**2** Wedge/screw assembly.
	
3 Install wedge/screw assembly into cutter body, but maintain assembly gap for installing insert.	**4** Slide insert, RNGN12... into pocket and torque wedge/insert assembly to 3,5 Nm (31 in/lbs). Repeat for each pocket.
	

NOVO KNOWS SEARCH

Searching for a tool has been enhanced by Advise and Select functions from NOVO™ applications — saving you time and money.

ADVISE

Uses a rules-based approach to provide cutting tool recommendations:

- Define Machining Feature (face milling, slotting, blind hole, etc.)
- Apply Constraint Requirements (geometric, material, tolerance, etc.)
- Set Machining Sequence (single or multi-step operations, rough then finish, etc.)
- Receive Ranked Results

SELECT

A method of selecting cutting tools from a tree structure via a hierarchy or parametric search:

- If you know which product you are looking for, a quick search can be performed by just the catalogue number or product description.
- Smart filters significantly reduce the amount of potential tooling solutions.
- After the tool is selected, NOVO also provides cutting and adaptive item options that fit with your solution.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximises every shift. **kennametal.com/novo**

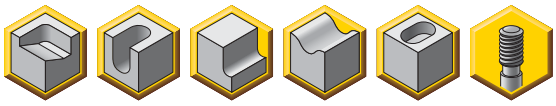
KIPR™

Ceramic Milling Cutters

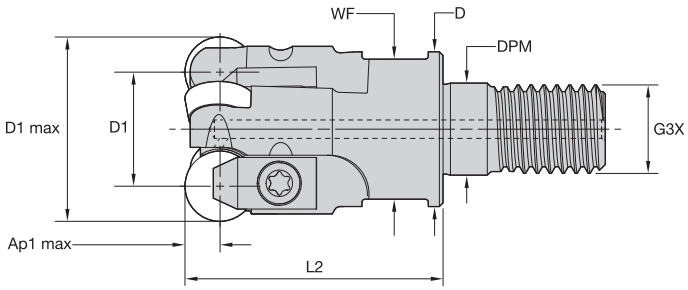
Primary Application

The Kennametal ceramic milling platform has been specifically engineered to machine high-temperature alloys, PH series, stainless steel, and hardened materials. With excellent productivity through the massive reduction of machining time, Kennametal ceramics can run more than 10 times faster than comparable carbide grades.

Features and Benefits



Unbeatable Productivity



- Engineering to provide outstanding metal removal rates and productivity in nickel-based and/or cobalt-based alloys, stellites, stainless steel, and PH series through HSM.
- High axial and radial runout accuracy.
- Improved insert clearance and thickness tolerance to increase overall performance.
- New clamping system design provides higher spare part tool life and reliability and higher RPM.

Usability and Offering

- Three grades and three insert sizes available to cover a wide range of applications.
- Wide diameter range with end mills and Screw-On cutters from diameter 16mm.
- High clearance on the cutters for superior ramping capacities.
- Through-coolant option in all the cutters. Only for air use.

- For machining high-temp alloys, PH stainless, stainless steels, and hardened materials.
- Excellent productivity through massive reduction of machining time.
- Face milling, pocketing, and ramping capabilities.
- Through-body coolant delivery for internal air supply only.

- For machining high-temp alloys, PH stainless, stainless steels, and hardened materials.
- Excellent productivity through massive reduction of machining time.
- Face milling, pocketing, and ramping capabilities.
- Through-body coolant delivery for internal air supply only.

NOTE: A — Use these tools with the appropriate equipment/machines. Machines have to be covered for safety reasons: Hot flowing chips and loud noises are involved, which is common during the milling process.
B — Use only air flows as coolant method.
C — Higher RPMs are involved; use balanced toolholder for higher tool life and safer operation.
D — Consider increasing the fz in hard machining when smaller Ap are applied.

Thread Milling • Application and Technical Information **W48–W55**

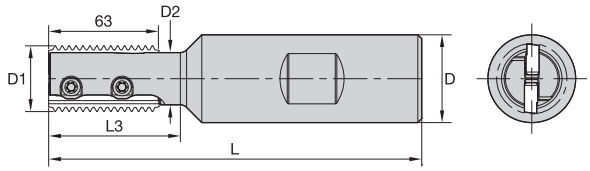
TM Series

The latest Kennametal indexable thread milling tools deliver longer tool life and higher productivity while offering a comprehensive range of thread styles and sizes:

- TM24 Series — Small-bore threading applications with one cutting edge per insert.
- TM25 Series — Standard threading applications with two cutting edges per insert.
- TM40 Series — Long-thread threading applications with two cutting edges per insert.
- TM41 Series — Large-pitch threading applications with two cutting edges per insert.

Features and Benefits

Cutter Body Offering

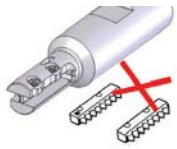


- Number of flutes:
  - TM24: 1–2 per body
  - TM25: 2–8 per body
  - TM40: 3–8 per body
  - TM41: 2–6 per body
- Short and long toolholders for multiple applications.
- Cutters available in parallel Weldon® and conical Weldon holders.
- Effective through coolant for each flute.
- Better chip evacuation.

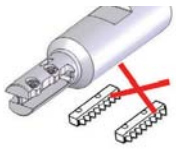
Insert Offering

- Robust design.
- Inserts for ISO, UN, W, NPT, NPTF, and BSPT Thread Profiles.
- Pitch:
  - 0,50–2,50mm (TM24: 32–10 TPI)
  - 1,00–3,00mm (TM25: 20–8 TPI)
  - 1,00–3,00mm (TM40: 32–10 TPI)
  - 3,00–6,00mm (TM41: 8–4 TPI)
- Grades for most workpiece materials.
- Easy clamping systems.
- Fast indexing of inserts.

- 14–16mm cutting diameter range.
- For internal and external threading on most types of workpiece materials.
- One tool is used for both right- and left-hand threads.
- All cutters have through-coolant capability.
- Utilises inserts with various profiles and pitches.



Thread Mill • Weldon Shank • Parallel Threads



order number	catalogue number	D1	D	D2	L	L3	Z	insert screw	Torx Plus driver

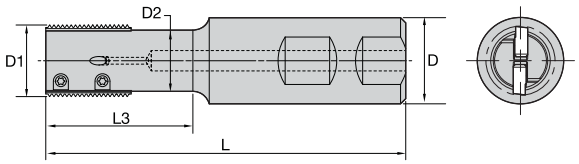
NOVO KNOWS CAD/CAM

With the addition of NOVO™ applications to your team, your CAD/CAM capabilities become much more accurate, streamlined, and productive.

Before NOVO: The programmer would be in their CAD/CAM software, programming a part. Using the tedious method of finding a tool in a catalogue, and then manually inputting the tooling information from the catalogue into the CAD/CAM software.



The concern is that assumptions are made, and only partial tooling information is entered.

With NOVO: The powerful digital intelligence of NOVO applications not only help the programmer find the right tool for the metalcutting job, but also automatically integrates all the tooling data into a complete CAD/CAM solution.
The integration of all the tooling data increases the viability of the part being programmed, and is delivered quickly — saving you time.

NOVO applications can ensure you have the right tools on your machines, in the right sequence. Resulting in flawless execution that accelerates every job, and maximises every shift. **kennametal.com/novo**

- 17–30mm cutting diameter range.
- For internal and external threading on most types of workpiece materials.
- One tool is used for both right- and left-hand threads.
- All cutters have through-coolant capability.
- Utilises inserts with various profiles and pitches.

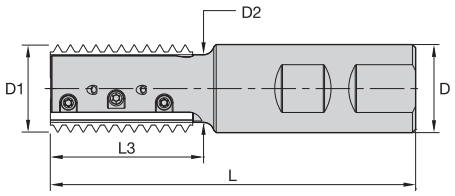
Carbide Recycling

Help preserve and protect our planet!

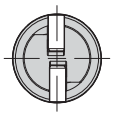
It's easy for your company to be environmentally conscious with the Kennametal Carbide Recycling Programme.

By sending us your used carbide tools, you help preserve and protect the environment and ensure that these products are recycled responsibly. Kennametal accepts any coated or non-coated carbide items, including inserts, drills, reamers, and taps.

By using the Kennametal Carbide Recycling Programme, you will receive:



- A partner who cares about a sustainable environment.
- Easy-to-use web portal to value your used carbide.
- Access to our popular Green Box™ options for carbide collection.
- Systematic and efficient disposal of carbide materials.
- Improved profitability.



Programme is not currently available in all geographical areas.
For more information, please visit **kennametal.com/carbiderecycling**.

KENNAMETAL®

kennametal.com

- 21–58mm cutting diameter range.
- For internal and external threading on most types of workpiece materials.
- One tool is used for both right- and left-hand threads.
- All cutters have through-coolant capability.
- Utilises inserts with various profiles and pitches.

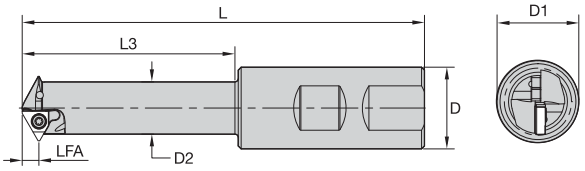
KTMD U Series

Primary Application

With a wide range of insert thread sizes and grades for most materials, KTMD U is a multiflute, single-point, high-productivity, and economical solution for milling threads in deep-hole applications.

Features and Benefits

Smooth Cutting Action



- Reduced load on the cutting edges due to single-point insert.
- Low cutting forces enable fast machining.
- Suitable for hard material applications.
- Wide range of applications, with partial profile insert (60°/55°).
- Pitch range 16–3 TPI (1,5–8mm).

Cost-Effective Solution

- Up to three cutting edges per insert.
- Very high feed per tooth.
- Fast machining.
- Multiflute — up to 7 cutting edges (inserts).

Comprehensive cutter bodies offering:

- Weldon®, steel, carbide, and shell mill cutters available.
- Long overhang capability.
- Through coolant capability.
- Diameter range 14,75–42mm (42–56mm shell mills).
- Improved chip evacuation and cooling.

TMS Series

Primary Application

The TMS series, a Kennametal Thread Milling System, is a versatile thread milling product with proven solutions. This tool is specially designed for internal and external threading on most types of workpiece materials. The cutter body utilises inserts with various profiles and pitches.

Features and Benefits

Proven solution and versatile indexable thread milling product family.

Comprehensive Offering of Cutter Bodies

- Standard Weldon®, Mini Weldon, long-thread Weldon, conical shank, and double-sided Weldon cutters are available.
- One tool is used for both right- and left-hand threads.
- All cutters have through coolant capability.

Double-Sided Weldon Cutter Bodies

- Provides faster machining capabilities.
- Good surface finish.

Inserts:

- Insert grades for most workpiece materials.
- Inserts for ISO, UN, BSPT, and NPT thread profiles.
- Indexable inserts.
- Economical and cost effective.
- Versatile application.

- For internal and external threading on most types of workpiece materials.
- One tool is used for both right-hand and left-hand threads.
- All cutters have through-coolant capability.
- Utilises inserts with various profiles and pitches.

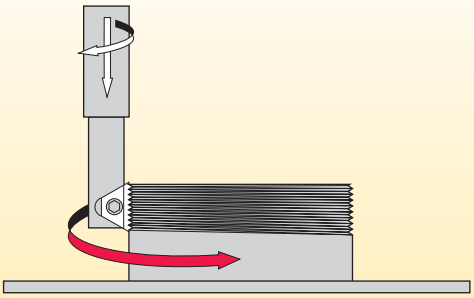
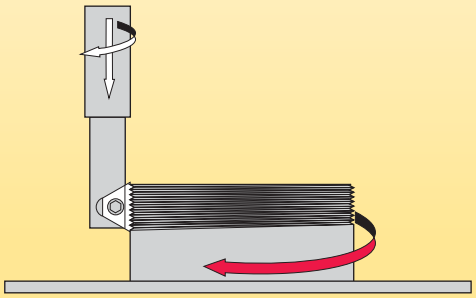
NOTE: Use Kennametal thread mill software:
TM-CNC Generator for CNC Programming on our website under: **http://www.kennametal.com/en/resources/software.html**.

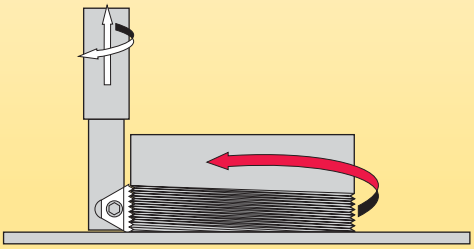


The Following Are a Few Thread Milling Methods (Work Directions)

NOTE: Climb milling results in lower cutting forces, better chip development, higher thread surface quality, and longer insert life. Therefore, it should be used whenever possible. But, in the case of some hardened materials or when milling certain difficult-to-machine exotic materials, conventional milling may be preferred.

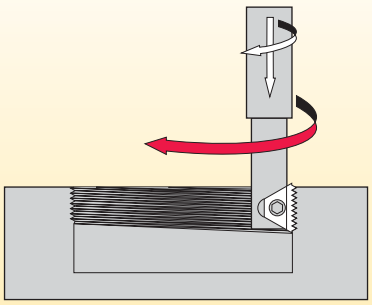


Methods of External Thread Milling

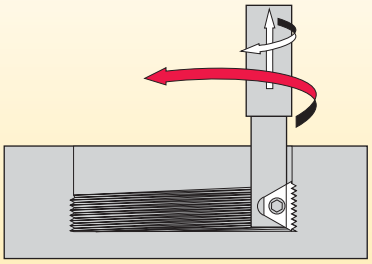


right-hand thread... conventional milling

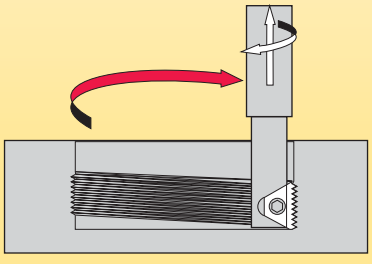
left-hand thread... conventional milling



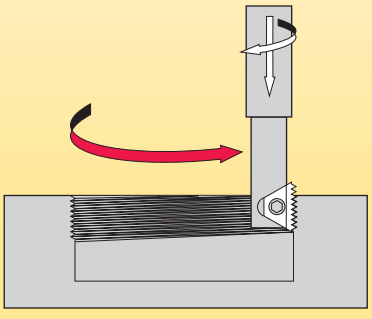
right-hand thread... climb milling



left-hand thread... climb milling



Methods of Internal Thread Milling



right-hand thread... conventional milling

left-hand thread... conventional milling

right-hand thread... climb milling

left-hand thread... climb milling

Application Guidelines

- All thread milling inserts are full profile or cresting type.
- Inserts are designed to mill full thread depth in one revolution or pass.
- When machining difficult materials, two passes may be desired. A 60% thread depth on the first pass and a 40% thread depth on the second pass is recommended.
- Thread relief grooves in blind holes are not necessary.
- Thread milling large parts requires considerably less horsepower compared to other threading methods.
- Thread milling produces short chips compared to stringy chips of other threading methods.
- One holder is suitable for many different thread pitches.
- PVD-coated inserts provide maximum tool life for a wide variety of materials.

Understanding Thread Milling

In order to perform a thread milling operation, a milling machine with three-axis control, capable of helical interpolation, is required. Helical interpolation is a CNC function producing tool movement along a helical path. This helical travel combines circular movement in one plane with a simultaneous linear motion in a plane perpendicular to the first. For example, the path from point A to point B (figure A) on the envelope of the cylinder combines a circular movement in the X and Y plane with a linear movement in the Z direction.

On most CNC systems, this function can be executed in two different ways:

- G02: helical interpolation in a clockwise direction
- G03: helical interpolation in an anti-clockwise direction

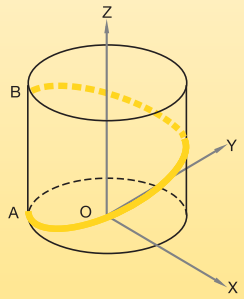
The thread milling operation (figure B) consists of circular rotation of the tool about its own axis together with an orbiting motion along the bore or workpiece circumference.

During one such orbit, the tool will move vertically one pitch length. These movements, combined with the insert geometry, create the required thread form.

There are two acceptable ways of approaching the workpiece with the tool to initiate production of the thread:

1. Along a tangential arc.
2. Along a tangential straight line.

NOTE: Climb milling is preferred.



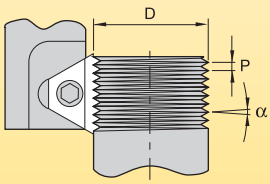


figure A

α - helix angle
D - external diameter
P - pitch

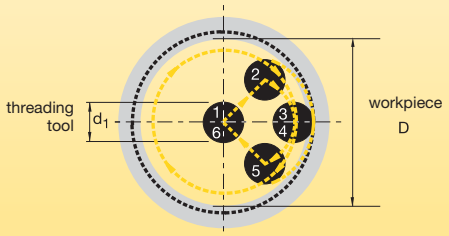

figure B

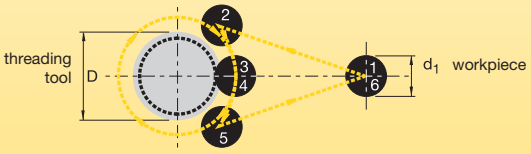
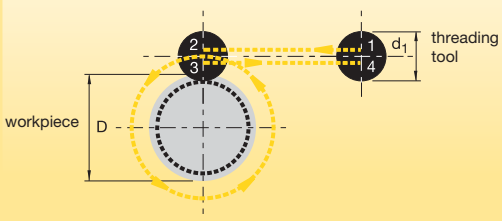
Tangential Approach (Arc)



With this method, the tool enters and exits the workpiece smoothly. No marks are left on the workpiece and there is no vibration, even with harder materials.

Although it requires slightly more complex programming, this is the method recommended for machining the highest quality threads.

1–2:	rapid approach
2–3:	tool entry along tangential arc with simultaneous feed along Z-axis
3–4:	helical movement during one full orbit (360°)
4–5:	tool exit along tangential arc with continuing feed along the Z-axis
5–6:	rapid return



internal left-hand thread

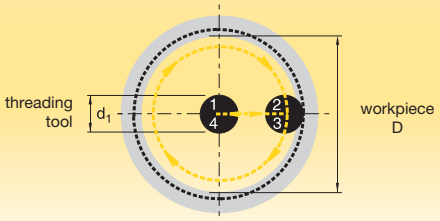
external thread

Tangential Approach (Line)

This method is very simple and has all of the advantages of the tangential arc method. However, it is applicable only to external threads.

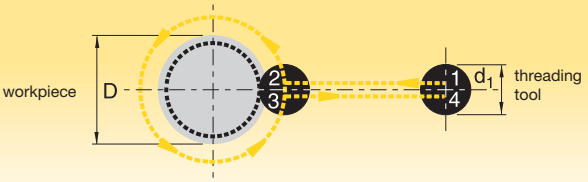
1–2:	radial entry with simultaneous feed along the Z-axis
2–3:	helical movement during one full orbit (360°)
3–4:	radial exit

Radial Approach



This radial approach is often considered the simplest. There are two characteristics worth noting about the radial approach:

a. A small vertical mark may be left at the entry (and exit) point. This is of no significance to the thread itself.



b. When using this method with very hard materials, there may be a tendency for the tool to vibrate as it approaches the full cutting depth.

1–2:	radial entry
2–3:	helical movement during one full orbit (360°)
3–4:	radial exit

NOTE: Radial feed during entry to the full profile depth should be only 1/3 of the subsequent circular feed.

internal thread

external thread

Calculation of Feed Rates at the Cutting Edge

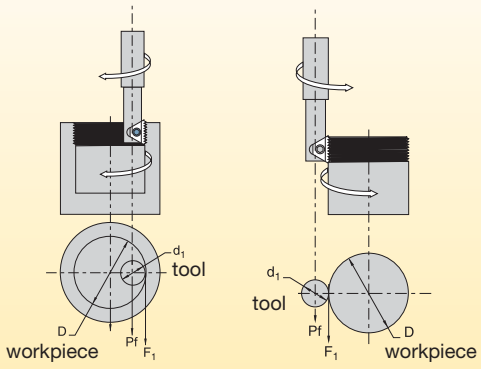
The first step is to calculate the tool feed rate at the cutting edge:

$$F_1 = fz \times Z \times n$$

F_1 = tool feed rate at the cutting edge (mm/min)
fz = mm per tooth (feed rate)
Z = number of effective inserts in cutter
n = rotational speed (spindle RPM)

The rotational speed (RPM) is calculated by the following formula:

$$RPM = \frac{1000 \times Vc}{\pi \times d_1}$$



SFM = cutting speed, surface feet per minute
d_1 = cutter diameter, over insert
π = 3,1416

Calculation of Programme Feed Rate

On most CNC machines, the feed rate required for programming is at the centreline of the tool. When dealing with linear tool movement, the feed rate at the cutting edge and the centreline are identical. With circular tool movement this is not the case. The following equations define the relationship between feed rates at the cutting edge and at the tool centreline.

$$P_1 = F_1 + \frac{(F_1 \times d_1)}{D}$$

P_1 = programme feed rate (mm/min)
D = major diameter (external thread)
D = minor diameter (internal thread)
d_1 = cutting diameter, over insert

external thread internal thread

tool workpiece

Step-by-Step Thread Milling Example

thread: internal right hand 11/4 x 16 UN–2B–RH(21)
material: AISI 4140 (300 HB)
thread diameters: D (minimum bore dia.) = 30mm
Do (nominal dia.) = 31,75mm
thread length: 12,77mm

For best thread quality, the cutter with the largest d1 (cutter diameter) should be used. This cutter diameter can be found in the table on page W49, as a function of pitch and minimum bore diameter "D". The result for the above example is that any cutter diameter 25mm or smaller can be utilised.

A cutter with a smaller d1 will perform the thread milling operation in less time. The smaller d1 may result in less tool rigidity, so it should be used with caution on very tough materials.

Find the appropriate normal-length shank cutter diameter on pages W40–W43
Use the minimum bore diameter table below for reference.

pitch (TPI)	24	20	16	12
pitch mm	1,0	1,25	1,5	2,0
cutter dia. d_1	minimum bore diameter D			
17,02	19,00	19,61	19,99	21,01
19,05	21,01	21,59	22,00	23,01
20,07	22,00	22,61	23,01	24,00

Figure B: cutter selected: K079TMIRW075STN16N
outer dimensions: d_1 = 20,07mm, R_t (radius of tool) = $d_1 \div 2$ = 10,035mm

Choosing Insert Size

The insert IC is defined by the selected cutter (STN16).
Use the appropriate insert table on pages W44–W46.

insert IC	a (mm)	pitch (TPI)	internal thread catalogue number	b thread length (mm)	number of teeth	grade KC610M	grade KC620M	external thread catalogue number	b thread length (mm)	number of teeth	grade KC610M	grade KC620M	cutter type

□ non-stock standard

Step-by-Step Thread Milling Example

Calculate the feed rates:

First, find the RPM.

$$RPM = \frac{1000 \times Vc}{\pi \times d_1} = \frac{1000 \times 150}{\pi \times 20} = 2387 \text{ RPM}$$

Next, calculate the feed rate at the insert cutting edge (F_1):

(using the chosen feed per tooth of 0,1mm.)

$$F_1 = F_z \times Z \times N = 0{,}1 \times 1 \times 2387 = 238{,}7 \text{ mm/min}$$

Finally, calculate the feed rate at the cutter centreline (F_2):

$$F_2 = \frac{F_1 \times (D - d_1)}{D} = \frac{238{,}7 \times (30-20)}{30} = 79{,}57 \text{ mm/min}$$

Select the thread milling method.

Climb milling (preferred) see page W48.

Calculate the radius of the tangential arc R_e:

$$R_e = \frac{(R_i - C_L)^2 + R_O^2}{2 \times R_O} = \frac{(15-0{,}5)^2 + 15{,}875^2}{2 \times 15{,}875}$$

R_e = 14,55mm

Calculate the angle (β):

$$\beta = 90° + \arcsin \frac{R_O - R_e}{R_e}$$

$$\beta = 90° + \arcsin \frac{15{,}875 - 14{,}55}{14{,}55}$$

β = 90° + 5.17° = 95,2° = 95° 12'

Calculate the movement along the Z-axis during the entry approach from point "A" to point "B" ($Z\alpha$). (NOTE: P = pitch)

$$Z_\alpha = P \text{ (mm)} \times \frac{\alpha°}{360°} = \frac{1{,}578}{4} = 0{,}394\text{mm because } \alpha = 90°$$

Calculate the "X" and "Y" values at the start of the entry approach.

X = 0Y = $R_i + C_L$ = 15 + 0,5 = 15,5mm

Define Z-axis location at the start of the entry approach. (NOTE: L = length of thread)

Z = (L + Z_α) = 12,7 + 0,3945 = 13,0945mm

Define the starting point.

$X_a = 0$

$Y_a = 0$

Step-by-Step Thread Milling Example

Appendix A

Derivation of Formulas for Internal Thread Milling

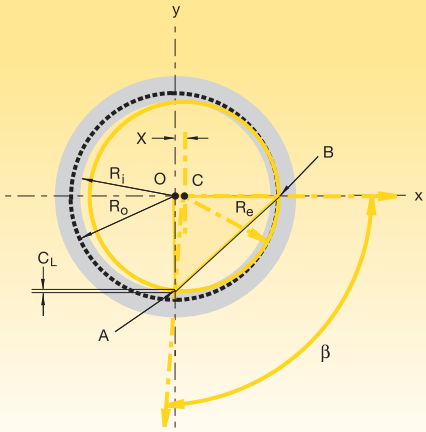
R_e, β, and X can be found by a geometric analysis of the entry path.

This entry path is defined by the tool traveling along a circular path, with a radius of R_e about the point C.

$$R_e = \frac{(R_i - C_L)^2 + R_o^2}{2R_o}$$

Triangle OAC enables us to simply solve for R_e.
Note that OAC is a right angle triangle, and that:

$OA = R_i - C_L$
$CA = R_e$
$OC = R_o - R_e$



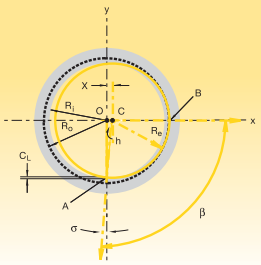
Pythagoras' law states: $OA^2 + OC^2 = AC^2$

Replacing actual values, we get:

$$(R_i - C_L)^2 + (R_o - R_e)^2 = R_e^2$$

Simplifying, we get:

$$R_e = \frac{(R_i - C_L)^2 + R_o^2}{2R_0}$$



Find the angle β.

$\beta = 90° + \sigma$

$\sin \sigma = \frac{OC}{CA} = \frac{(R_o - R_e)}{R_e}$

$\sigma = \text{arc sin} \left(\frac{R_o - R_e}{R_e}\right)$

Therefore, $\beta = 90° + \text{arc sin} \left(\frac{R_o - R_e}{R_e}\right)$

Appendix B

Derivation of Formulas for External Thread Milling

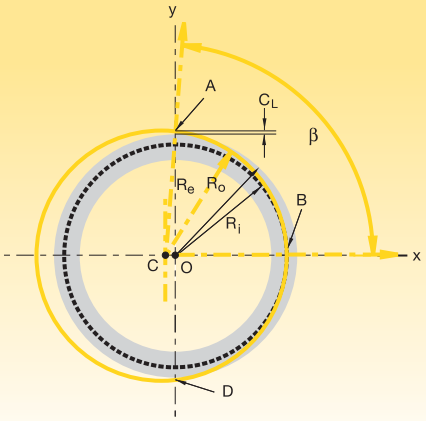
R_e, β, and X can be found by a geometric analysis of the entry path.

This entry path is defined by the tool traveling along a circular path, with a radius of R_e about the point C.

$$R_e = \frac{(R_o - C_L)^2 + R_i^2}{2R_i}$$

Triangle OAC enables us to simply solve for R_e.
Note that OAC is a right angle triangle, and that:

$OA = R_o - C_L$
$CA = R_e$
$OC = R_e - R_i$



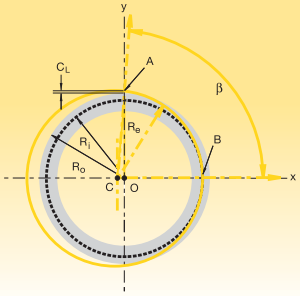
Pythagoras' law states: $OA^2 + OC^2 = AC^2$

Replacing actual values, we get:

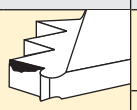
$$(R_o - C_L)^2 + (R_e - R_i)^2 = R_e^2$$

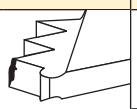
Simplifying, we get:

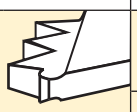
$$R_e = \frac{(R_o - C_L)^2 + R_i^2}{2R_i}$$



Find the angle β.







β can be easily found using the same triangle:

$\sin \beta = \frac{AO}{AC} = \frac{(R_o + C_L)}{R_e}$

$\beta = \text{arc sin} \left(\frac{R_o + C_L}{R_e}\right)$

Thread Mill Troubleshooting

problem	possible cause	solution
excessive insert flank wear 	• Cutting speed too high.	• Reduce cutting speed.
	• Chip is too thin.	• Increase feed rate.
	• Insufficient coolant.	• Increase coolant quantity/pressure.
chipping of cutting edge 	• Chip is too thick.	• Reduce feed rate. • Use the tangential arc method of entrance. • Increase RPM.
	• Vibration.	• Check rigidity.
material build-up on the cutting edge 	• Cutting speed too slow.	• Increase cutting speed.
	• Chip thickness too small.	• Increase feed rate.
chatter/vibration	• Feed rate is too high.	• Reduce the feed.
	• Profile is too deep (coarse pitch threads).	• Execute two passes, each with increased cutting depth. • Execute two passes, each cutting only half the thread length.
	• Thread length is too long.	• Execute two passes, each cutting only half of the thread length.
insufficient thread accuracy	• Tool deflection.	• Reduce feed rate. • Execute a zero cut.

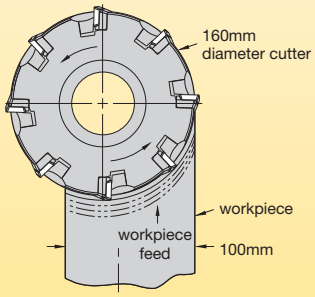
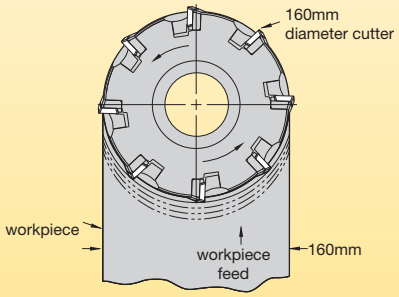
Bit Adaptor

Order Number	Catalogue Number	Drive Size	Description
1963869	DRIVER	hex 1/4"	Bit Adaptor suitable for standard and extended length 1/4" drive bits



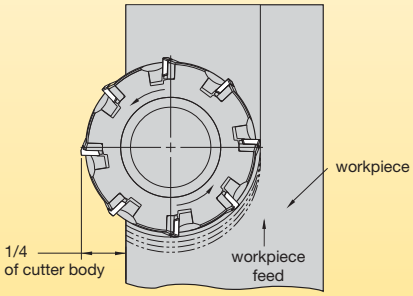
Workpiece dimensions determine the best face mill diameter to select.

Cutter-to-part width-of-cut ratio should be approximately 3:2 or 1 1/2 times the part width. For example, if the width of cut is 100mm, choose a 160mm diameter cutter. If the width is extremely wide, select a cutter diameter that matches the spindle capacity and take multiple passes. For example, if the width of cut is 610mm and the machine has a standard #50 taper spindle, you should use an 200mm diameter cutter and take five passes, at slightly less than 125mm per pass, or four passes at 160mm per pass, depending on horsepower and rigidity.



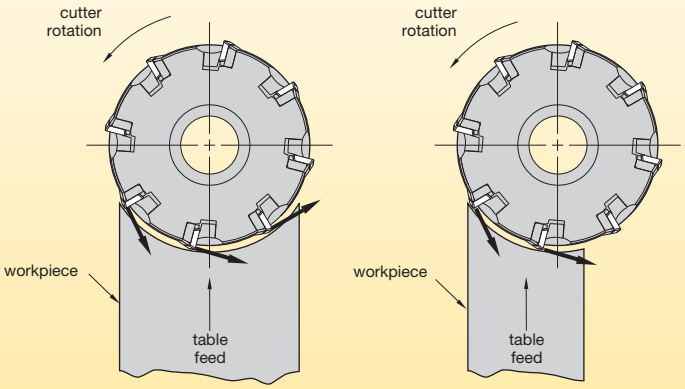
An undesirable situation is when the cutter diameter is about equal to the width of cut. The chip being formed at the entrance and exit of the cut will be very thin. The thin chips formed cannot carry away heat as well as thicker chips; therefore, the heat is transferred back into the insert causing premature edge failure. Work-hardening is also more likely to occur in the entry and exit area.

When the proper cutter diameter is not available, proper cutter positioning will provide positive results.



- Position cutter with approximately 1/4 of the cutter body outside the workpiece and make two passes.
- Produces negative angle of entry (desirable).
- Can result in longer tool life.

desirable



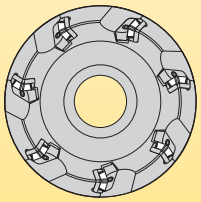
undesirable

cutter position

Cutter Positioning/Cutting Forces

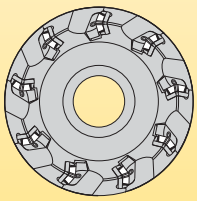
The cutting forces are constantly changing as the inserts move through the cut. We should understand that in changing the position of the cutter in relation to the workpiece, we can re-direct the cutting forces. This is important to ensure a safe operation based on fixture design, workpiece design, and workpiece considerations.

Pitch, or density, refers to the number of inserts in a cutter. Cutters can be classified as having either coarse, medium, or fine pitch. When designing a cutter, the engineer must take the depth of cut and feed per tooth into consideration. He then must provide the necessary chip clearance in the body so that the chip can pass without restricting its formation. For this reason, cutters designed for heavy metal removal have maximum chip clearance. This, therefore, restricts the number of inserts in the cutter, making it a coarse pitch cutter.



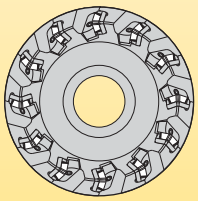
In medium pitch cutters, the chip clearance area in the body is usually slightly smaller than a coarse pitch cutter. And, in fine pitch cutters, the chip clearance is considerably less.

Coarse pitch is recommended for general purpose milling where adequate horsepower is available, and where maximum depth of cut is required.



Medium pitch is recommended when moderate feed per insert is required, and where it is more advantageous to have more than one insert in the cut. Medium pitch also reduces entry shock and cutting pressure while maintaining feed rates.

Fine pitch is ideal when milling a severely interrupted surface such as a manifold block. Fine pitch cutters are capable of higher inch/mm per minute feed rates than medium or coarse pitch cutters. They also experience higher cutting forces and greater horsepower consumption than medium or coarse pitch cutters do.



Differential pitch is a differential-pitch milling cutter with unequally spaced inserts. This configuration breaks up the harmonics that result from equally spaced inserts, greatly reducing the chance of vibration. Most cutters use this design regardless of the cutter pitch.

medium pitch

fine pitch

differential pitch

Lead Angles/Cutting Forces on Workpiece and Fixturing

Cutting forces produced during the milling process are constantly changing as the insert moves through the cut. Understanding the relationship of these forces will help ensure safe operation by preventing workpiece movement during the cut. For example, fixture design and clamp positioning are determined by the cutting forces produced in milling. Equally important is an understanding of the effect lead angle has on cutting force direction, actual chip thickness, and tool life.

90° Lead Angle

Advantages:

- When 90° shoulder is required.
- Can be a problem solver on thin wall workpieces.

Disadvantages:

- Highest radial cutting forces.
- High entry shock load.
- Increased chance of bur on insert exit side of part.

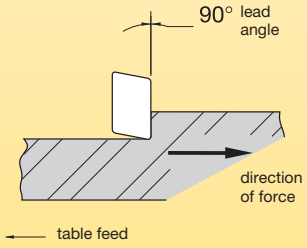
75° and 70° Lead Angle

Advantages:

- For general milling applications and relatively rigid conditions.
- Good relation of insert size and maximum depth of cut.
- Reduced entry shock load.

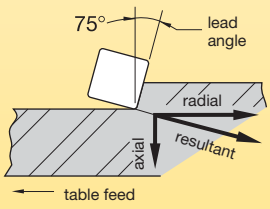
Disadvantages:

- Higher radial forces can cause problems in weak machine/workpiece/fixture conditions.



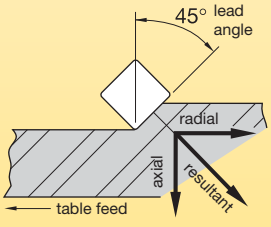
45° Lead Angle

Advantages:



- Well-balanced axial and radial cutting forces.
- Less breakout on workpiece corner.
- Entry shock minimised.
- Less radial forces directed into spindle bearings.
- Higher feed rates possible.

Disadvantages:



- Reduced maximum depth of cut due to lead angle.
- Larger body diameter can cause fixture clearance problems.

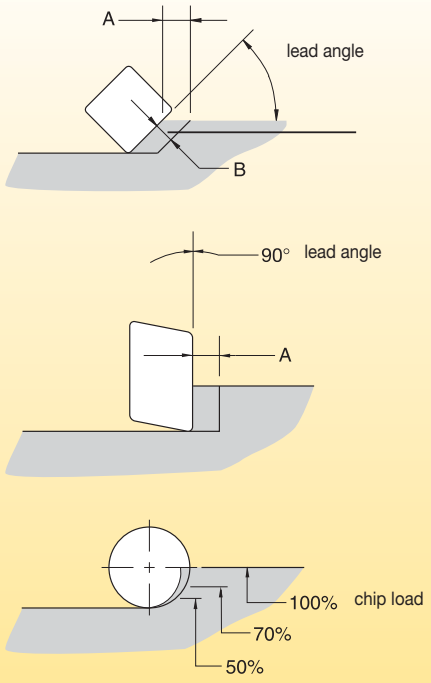
75° and 70° lead

45° lead

(continued)

(continued)



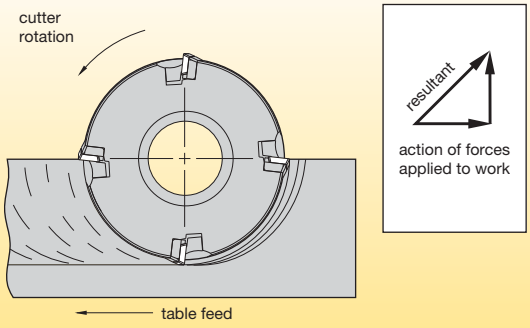
Lead Angle/Chip Thickness

Chip thickness is affected by lead angle. The greater the lead angle, the thinner the chip will be since it's distributed over a greater length of the cutting edge. To achieve greater productivity and problem-free milling, use a lead angle cutter whenever possible.

lead angle	feed per tooth	actual chip thickness "B"
90°	A	A
75°	A	.96 x A
70°	A	.94 x A
60°	A	.86 x A
45°	A	.707 x A

example:

90°	0,25mm	0,25mm
75°	0,25mm	0,24mm
70°	0,25mm	0,24mm
60°	0,25mm	0,22mm
45°	0,25mm	0,18mm



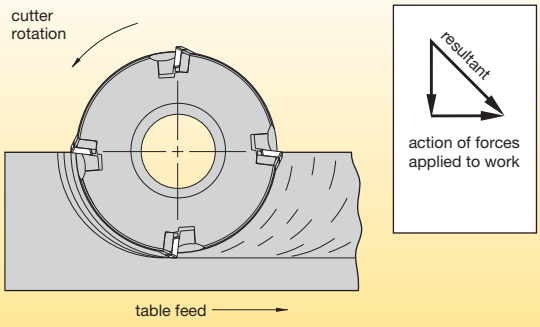
On round inserts, the chip load and lead angle vary with the depth of cut.

lead angle/chip thickness

Conventional Milling

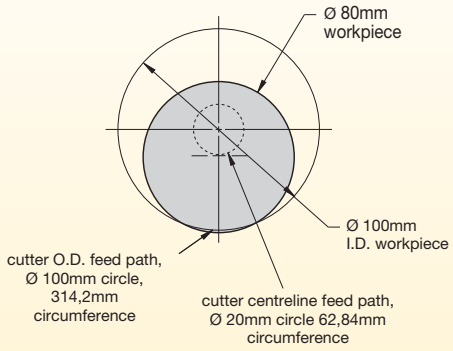
For many years, it was common practice to mill against the direction of the feed due to the use of high-speed steel cutters and an absence of backlash-eliminating devices. The milling procedure became known as conventional, or up-milling.

In conventional milling, friction and rubbing occur as the insert enters into the cut, resulting in chip welding and heat dissipation into the insert and workpiece. Resultant forces in conventional milling are against the direction of the feed. Work-hardening is also likely to occur.



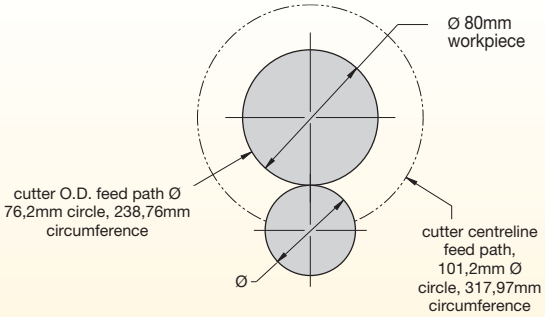
conventional milling

Climb Milling (preferred)



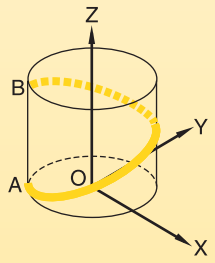
Climb milling is normally recommended. The insert enters the workpiece material with some chip load and produces a chip that thins as it exits the cut. This reduces the heat by dissipating it into the chip. Work-hardening is minimised.

Climb milling forces tend to push the workpiece toward the fixture and in the direction of the feed. Climb milling is preferred over conventional milling in most situations.



climb milling

Circular Interpolation: Consists of a cutter rotating about its own axis while traveling in an orbiting motion about an I.D. or O.D. workpiece circumference without any vertical shift during the operation. This orbiting movement utilises the "X" and "Y" axis.



I.D. circular interpolation

O.D. circular interpolation

Helical Interpolation: This application requires a milling machine with three-axis control capability. The operation consists of a cutter rotating about its own axis together in an orbiting motion about an ID or OD workpiece circumference in the "X" and "Y" plane. The circular movement about the "X" and "Y" plane, with a simultaneous linear movement in the Z-axis plane (which is perpendicular to the "X" and "Y" plane), creates the helical movement. For example, the path from point A to point B on the envelope of the cylinder combines a circular movement in the "X" and "Y" plane with a linear movement in the "Z" direction. On most CNC systems, this function can be executed in two different ways:

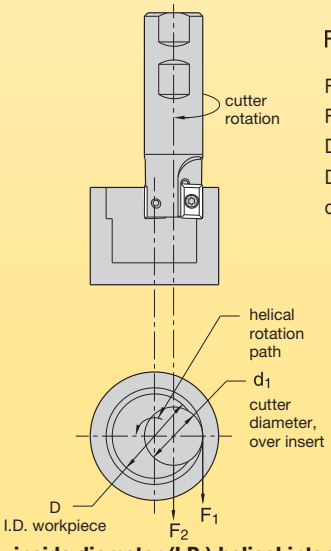
- GO2: helical interpolation in a clockwise direction.
- GO3: helical interpolation in an anti-clockwise direction.

helical interpolation

Calculation of Feed Rate for Circular and Helical Interpolation: On most CNC machines, the feed rate required for programming contour (circular or helical) milling is calculated based on the centreline of the tool. When dealing with linear tool movement, the feed rate at the cutting edge and centreline are identical, but with circular tool movement, this is not the case.

Calculate Feed Rate at the Cutting Edge: First calculate the tool feed rate at the cutting edge with the following formula.

$F_1 = fz \times z \times n$



F_1 = tool feed rate at the cutting edge (mm/min)

f_z = mm per tooth (chip load)

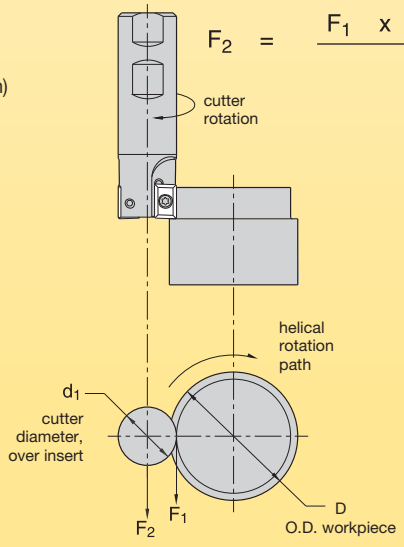
Z = number of effective inserts in the cutter

n = revolutions per minute

Calculation of the Feed Rate at the Tool Centreline: Use the following equations to define the relationship between feed rates at the cutting edge and at the tool centreline.

inside diameter (I.D.) helical interpolation

$$F_2 = \frac{F_1 \times (D - d_1)}{D}$$



F_1 = tool feed rate at the cutting edge (mm/min)

F_2 = tool centreline feed rate (mm/min)

D = O.D. workpiece diameter

D = I.D. workpiece diameter

d_1 = cutter diameter, over insert

outside diameter (O.D.) helical interpolation

$$F_2 = \frac{F_1 \times (d_1 + D)}{D}$$

(continued)

(continued)

In I.D. contour applications, you will find the tool centreline feed is always less than the cutting edge feed rate.

Example for I.D.

D = 100mm (4") I.D. workpiece
d_1 = 80mm (3") cutter diameter
fz = 0,2 mm/tooth (.008 IPT)
n = 637 RPM
z = 7 effective inserts

1. Calculate feed rate at the cutting edge.

$F_1 = fz \times z \times n$
$F_1 = 0.2 \times 7 \times 637 = 892$ mm/min (008 x 7 x 637 = 35.7 in./min)

2. Calculate feed rate at the tool centreline.

$$F_2 = \frac{F_1 \times (D - d_1)}{D}$$

$$F_2 = \frac{35.7 \times (4.0 - 3.0)}{4.0} = 8.9 \text{ in./min}$$

$$F_2 = \frac{892 \times (100 - 80)}{100} = 178 \text{ mm/min}$$

To have (F_1) 892 mm/min at the cutting edge feed rate, we must programme the machine tool for (F_2) 178 mm/min at the tool centreline feed rate. This is a difference of approximately 75% less feed than the cutting edge feed rate (F_1).

In O.D. contour applications, you will find the tool centreline feed rate is always larger than the cutting edge feed rate.

Example for O.D.

D = 125mm (5") O.D. workpiece
d_1 = 50mm (2") cutter diameter
f_z = 0,2 mm/tooth (.008 IPT)
n = 955 RPM
z = 5 effective teeth

1. Calculate feed rate at the cutting edge.

$F_1 = fz \times z \times n$
$F_1 = 0.2 \times 5 \times 955 = 955$ mm/min (.008 x 5 x 955 = 38.2 in./min)

2. Calculate feed rate at the tool centreline.

$$F_2 = \frac{F_1 \times (d_1 + D)}{D}$$

$$F_2 = \frac{38.2 \times (2 + 5)}{5} = 53.5 \text{ in./min}$$

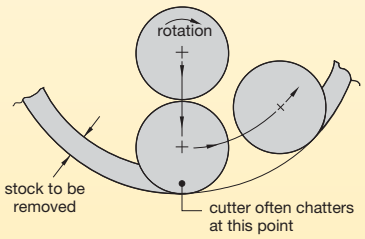
$$F_2 = \frac{955 \times (50 + 125)}{125} = 1{,}337 \text{ mm/min}$$

To have (F_1) 38.2 in/min (955 mm/min) at the cutting edge feed rate, we must programme the machine tool for (F_2) 53.5in/min (1,337 mm/min) at the tool centreline feed rate. This translates to an increase of about 40% more feed rate than the cutting edge feed rate (F_1).

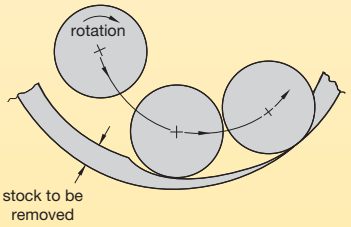
Large Surfaces

Interpolating with a smaller cutter may be faster than using a large diameter cutter. Also, keep the cutter in contact with the workpiece rather than exiting and re-entering.

Maximise Metal Removal Rate



Concentrate on Metal Removal Rate (MRR), not just on higher vc (cutting speeds). Increasing spindle speed without increasing chip load will not improve MRR. However, by doubling fz, MRR does increase and horsepower consumption only increases by approximately 50%.

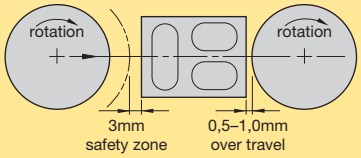


Preset

Use cutter preset areas for proper setting of cutters rather than indexing cutters at the machine, if possible.

Ramp In and Out

As shown below, ramping gradually into the cut will provide greater tool life. Also, by keeping the cutter constantly moving when entering and exiting the cut, dwell marks will be eliminated on the workpiece.



Safety and Over Travel

Programme the milling cutter to rapid advance up to the part, within a range of 3mm before engaging the workpiece. This allows the machine to reach its proper operating parameters before actual chip making begins.

Rapid advance to the next cutting location, when the cutter is 0,5mm to 1mm past the edge of the part. If the spindle has built-in tilt or programmed runout, the cutter can be advanced to the next cutting location while the back half of the cutter is still over the finished milled surface.

π = 3.1416

Slotting or Periphery Milling

True or actual chip load on the cutting edge of the insert is equal to the programmed chip load only when 50% or more of the cutter's diameter is engaged in the cut (lead angle not considered). Anything less than half the diameter of the cutter means that the actual chip load is reduced by some percentage. The smaller the radial depth of cut, the greater the decrease in actual chip load.

It's very important to maintain a chip load which is great enough to ensure heat dissipation and prevent work hardening. A sufficient chip load will also create stability between the cutter and the workpiece.

The formulas shown below are used to determine the programmed chip load, or feed rate necessary to obtain the desired load on the insert cutting edge as it enters the workpiece. These formulas should be applied whenever an arbour mounted slotting cutter is being used, or when less than half the diameter of a face mill or end mill is engaged in the cut. The lighter the radial depth of cut, the more important it becomes to apply these productivity formulas.

Productivity Formulas

$$\text{chip load (fz)} = \frac{\left(\frac{\sqrt{(\text{dia.} - y) \times (y)}}{\text{radius}}\right) \times \left(\frac{vf}{n}\right)}{z}$$

or

$$Vf = \frac{n \times z \times fz}{\left(\frac{\sqrt{(\text{dia.} - y) \times (y)}}{\text{radius}}\right)}$$

Operations such as **periphery milling with a light radial depth of cut or slotting with an arbour mounted cutter** require a calculation for feed rate compensation to maintain the proper chip load on the insert edge at entry into the cut. The calculated chip load and actual chip load can be dramatically different, depending on the radial depth and the cutter diameter. For instance, the actual chip load on entry for a 20mm diameter cutter taking a 0.3mm radial depth cut is only 23% of the calculated chip load. It is not uncommon to encounter built-up edge, work-hardening, or chatter problems if the following formula is not applied. Minimal cutter runout is critical to obtaining an equal chip load on each flute of the cutter too. A side benefit to applying this formula is increased productivity as feed rates can increase dramatically.

Formulas — Horsepower

Metal Removal Rate

The Metal Removal Rate (MRR) calculation is a good basis for determining metalcutting efficiency.

MRR = doc x woc x Vf = mm^3/min.

Horsepower Consumption

Milling cutters can consume significant amounts of horsepower. Very often it is the lack of horsepower that is the limiting factor when deciding on a particular operation. On applications where large diameter cutters or heavy stock removal is necessary, it's advantageous to first calculate the necessary horsepower requirements.

NOTE: Spindle efficiency "E" varies from 75 to 90%.

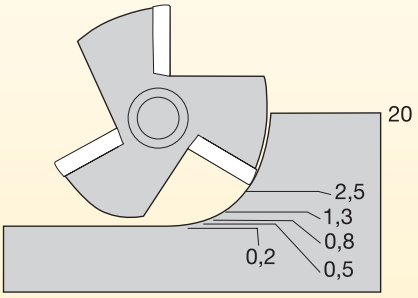
(E = .75 to .90)

A suitable formula for calculating horsepower (HP_c) at the cutter is:

$$HP_c = \frac{MRR}{K}$$

example:
width of cut (woc) 42mm
depth of cut (doc) 5mm
feed (vf) . . . . . 1092 mm/min
4140 220 HB . . . . . "K" factor 1.56

MRR = 5 x 42 x 1092 = 229320 mm^3/min



For horsepower at the motor (HP_m), use formula:

$$HPm = \frac{HPc}{E}$$

In determining horsepower consumption, "K" factors must be used. The "K" factor is a power constant that represents the number of cubic inches of metal per minute that can be removed by one horsepower.

NOTE: "K" factors vary depending on the hardness of the material.

radial depth of cut	actual chip load (fz)	feed required (Vf) to maintain fz = 0,1	increase
20	0,1	140	0%

Over the past 50 years, Metal Removal Rates (MRR) and power constants have served as the conventional values used to calculate horsepower. Although this is a relatively common method of calculating horsepower, a more accurate method has been developed when milling with high shear cutters. This new approach utilises the following information:

1. calculating tangential force (F_t)
2. ultimate material strength
3. cross-sectional area of the chip
4. number of inserts in the cut
5. machinability factor
6. tool wear factor
7. calculating torque
8. calculating horsepower at cutter
9. calculating horsepower at motor

Tangential Force, Torque, and Horsepower Calculations in Face Milling with High Shear Milling Cutters

1. Calculation of tangential force (N)

Calculation of tangential force is important since it produces torque at the spindle and accounts for the greatest portion of machining power at the cutting tool. Using this tangential force formula is a quick way to determine the approximate forces that fixtures, part wall sections, or spindle bearings will endure. Tangential force is calculated with the following formula:

$$F_t = S \times A \times Z_c \times C_m \times C_w \text{ (N)}$$

where: S = ultimate strength of the work material (N/mm^2)
A = cross-sectional area of the chip removed by the milling insert (mm^2)
Z_c = number of inserts in cut
C_m = machinability factor
C_w = tool wear factor

2. Ultimate material strength (N/mm^2)

The approximate relationship between the ultimate material strength and hardness of the most commonly used work materials such as steels, irons (for example: grey cast iron), titanium alloys (Ti – 6Al – 4V), and aluminium alloys (2024, 5052) can be expressed by the empirical formula:

$$S = 5 \times HB \text{ (N/mm}^2\text{)}$$

Where HB = Brinell hardness numbers obtained, primarily, at the 3000-kgf load. When testing soft metals such as aluminium alloys, the 500-kgf load is used. Hardness obtained at the 500-kgf load should be converted into the hardness equivalent of the 3000-kgf load by using the load factor of 1.15. For example, 130 HB at the 500-kgf load is equivalent to 150 HB at the 3000-kgf load (130 x 1.15 = 150). If hardness is given in Rockwell “B” or Rockwell “C” numbers, see the Material Listing Overview on page Y191.

3. Cross-sectional area of the chip (A)

Cross-sectional area of the chip (Fig. 1) is defined by:

where: A = d f (mm^2)
d = axial depth of cut (mm)
fz = feed per tooth (mm)

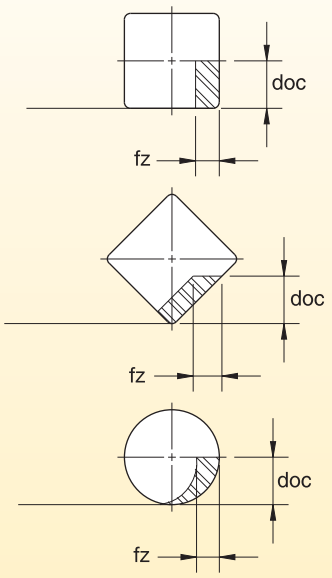

Figure 1: Cross-sectional area of the chip and insert’s shape

4. Number of inserts in cut (Zc)

The number of inserts in the cut (simultaneously engaged with work material) depends on the number of inserts in the cutter “Z” and the engagement angle (α). This relationship is shown by the formula:

$$Z_c = \frac{Z \times \alpha^\circ}{360^\circ}$$

The engagement angle depends on the width of cut “W” and cutter diameter “D”. This angle is found from the geometry of figure 2 (formulas to calculate engagement angle and the number of inserts in the cut at any width of cut are given in the appendix on page X20).

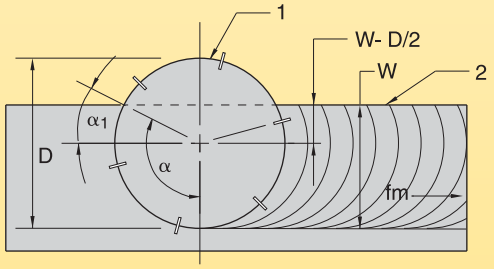

Figure 2: Schematic for calculating the number of inserts in cut

1 = milling cutter
2 = workpiece
α = engagement angle
α_1 = the angle between cutter centreline and cutter radius to the peripheral point of exit or entry
W = width of cut (woc)
D = cutter diameter
fm = workpiece feed motion

(continued)

(continued)

If the width of cut equals cutter diameter (W/D = 1.0), the engagement angle $\alpha = 180°$ and $Z_c = \frac{Z \times 180°}{360°} = 0.5Z$.

If the width of cut is equal to half of the cutter diameter (W/D = 0.5), the engagement angle $\alpha = 90°$ and $Z_c = \frac{Z \times 90°}{360°} = 0.25Z$.

The values of Z_c depending on the given W/D ratios, are shown in table 1.

Table 1

W/D	.88	.80	.75	.67	.56	.38	.33	.19	.125
Z_c	.38Z	.35Z	.33Z	.30Z	.27Z	.21Z	.20Z	.14Z	.12Z

5. Machinability factor (C_m)

Machinability factor is used to indicate degree of difficulty in machining various workpiece materials. Table 2 shows machinability factor values for some of the most common workpiece materials.

Table 2

workpiece material	C_m W/D≤.67	.67<W/D<1.0	W/D=1.0
carbon and alloy steels	1.0	1.15	1.3
stainless steel	2.0	2.15	2.3
grey cast iron	1.0	1.15	1.3
titanium alloys	1.0	1.20	1.4
aluminium alloys	1.0	1.05	1.1

The values of C_m are based on milling tests with a torque dynamometer at different cutting conditions. It has been found that machinability factor depends on type of work material and the ratio of radial width of cut to cutter diameter (W/D).

This ratio determines the uniformity of the chip thickness. When W/D = 1.0, the chip at the point of entry starts off at zero thickness. It increases to a maximum thickness at the centreline of the cutter, and thins off to zero again at the point of exit. This type of cut generates maximum friction at the cutting edge, and machinability factor reaches its maximum value. The optimal cutting conditions are obtained when W/D = 2/3 = .67. The thickness of the chip is practically uniform, the friction is minimal, and machinability factor decreases to its minimum value.

More extensive testing will determine machinability factors for a larger variety of work materials and improve the accuracy for calculating tangential force and power consumption.

6. Tool wear factor (C_w)

For milling with sharp cutting tools (short time operation), tool wear factor $C_w = 1.0$. For a longer operation (before the inserts are indexed), the following tool wear factors are considered:

- light face milling $C_w = 1.1$
- general face milling $C_w = 1.2$
- heavy-duty face milling $C_w = 1.3$

7. Calculation of torque (Nm)

The torque "T" generated by tangential force is calculated using the following formula:

$T = F_t \times D/2$ (Nm)

where D = cutter diameter (m)

8. Calculating horsepower (HP_c or HP_m)

The machining power at the cutter (sharp edges) is calculated by either of these two formulas:

$$HP_c = \frac{F_t \times Vc}{10{,}000}$$

or

$$HP_c = \frac{T \times n}{1{,}600}$$

where vc = peripheral cutting speed (m/min)
n = spindle speed (RPM)
10000 and 1600 = conversion factors

9. The required power at the motor is calculated using the following formula (HP_m):

$$HP_m = \frac{HP_c}{E}$$

where E = machine tool efficiency factor (E = .75–.90)

NOTE: Spindle efficiency varies from 75–90%.

(continued)

(continued)

Example for Calculating Horsepower

given values:

milling cutter KSOM125R06OF07:

effective diameter	D = 125mm
number of inserts	Z = 6

workpiece material:
alloy steel AISI 4140
hardness 220 HB

machining conditions:

spindle speed	n = 458 RPM
cutting speed	Vc = 180 m/min
machine feed rate	Vf = 824 mm/min
mm per tooth (chip load)	fz = 0,3mm
axial depth of cut	doc = 4mm
radial width of cut	woc = 90mm
W/D ratio	W/D = 0,72

Step-By-Step Calculations

1. Calculating tangential force

1.1 ultimate strength of the workpiece material
$S = 5 \times HB = 5 \times 220 = 1100\ N/mm^2$

1.2 cross-sectional area of the chip
$A = doc \times fz = 4 \times 0,3 = 1,2\ mm^2$

1.3 number of inserts in cut:
width of cut-to-diameter ratio (w/d)
W/D = 90 / 125 = 0,72 (See Table 1, page X12)
Now use Z_c value shown in Table 1 under 0,72.
Zc = 0,33 x Z = 0,33 x 6 = 2 inserts in cut.

NOTE: Z = number of inserts in cutter.

1.4 tangential force
$Ft = S \times A \times Z_c \times C_m \times C_w$
$Ft = 1100 \times 1,2 \times 2 \times 1.1 \times 1.1 = 3194\ N$

NOTE: $C_m = 1.1$ and $C_w = 1.1$

2. Calculating torque at the cutter

$$T = (F_t \times D)/2 = \frac{3,194 \times 0,125}{2} = 199,6\ Nm$$

3. Calculating horsepower

- At the cutter...reference formulas in paragraph 8 on page X12.

$$HP_c = \frac{F_t \times Vc}{10,000} = \frac{3,194 \times 458}{10,000} = 57,5hp$$

or

$$HP_c = \frac{T \times RPM}{1,600} = \frac{1,996 \times 458}{1,600} = 57,5hp$$

- At the motor...reference formula in paragraph 9 on page X12.
- Where E = machine tool efficiency factor (E = .75 to .90).

$$HP_m = \frac{HP_c}{E} = \frac{57,5}{.8} = 71,9\ hp$$

Surface finish may be an important specification on a machined part. Finishes produced by indexable insert cutters usually range from 0.80–3.2 (32–150) Ra. This broad range can be affected by several variables such as work material, machine rigidity, spindle alignment, fixturing, insert nose geometry, insert wear, cutting feed and speed, heat-generated chip welding, and chatter.

Good finishes will result when you use the right combination of cutter geometry, insert style, and cutting speeds and feeds for the material being milled. It is also important to have the part adequately fixtured, and the machine properly maintained.

Figure 1 illustrates that finer finishes can be obtained by using a larger corner radius, flat, or wiper on the insert. This tends to wipe out or reduce feed marks. In addition to the corner geometry of the insert, it is important to correctly set each insert relative to the other inserts. For example, if all of the inserts have the same corner geometry, and are set in the cutter body to a face height of approximately 0,025mm relative to each other, the finish produced will be better than if the inserts were set to within 0,07mm.

Improved finishes can also be obtained by increasing speeds and reducing feeds. Be aware, however, that increased speed also increases cutting temperatures, and may reduce insert edge life.

Finish will not necessarily be the same on all areas of the milled surface. Figure 2 shows that the Ra finish will be lower on the area where the feed marks are close to each other, and higher where feed marks are farther apart.

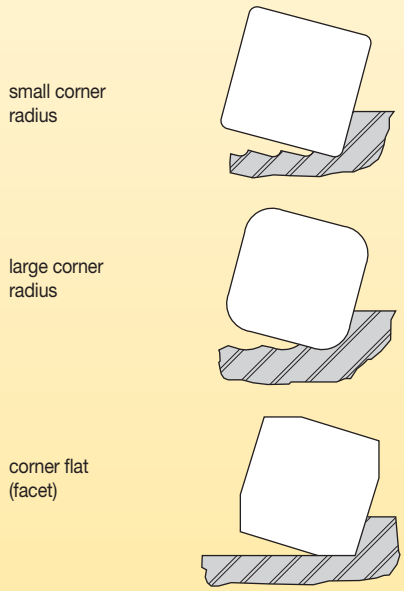

Figure 1: Larger insert corner radii or flats produce finer milling finishes.

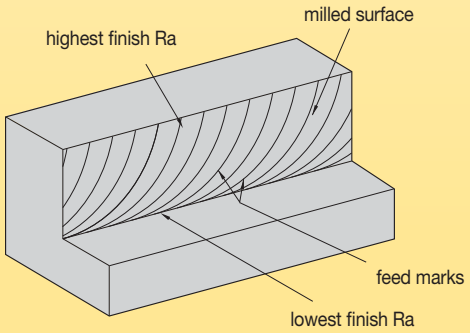

Figure 2: Quality of Ra finish corresponds to the distance between feed marks.

In figure 3, the Ra value will be lower near the outside diameter of the cut where the feed marks are at their closest, and higher at the centre where the feed marks are farthest apart. Peaks produced are highest at the centre of the cutter as it is positioned in the cut, and lowest at the outside diameter of the cutter, as illustrated below in figures 3 and 4.

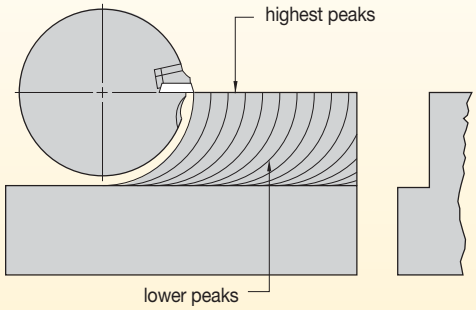

Figure 3: Ra finish is higher at the widest feed marks.

Both finish and flatness are affected by feed marks. A taper will be produced from the high peaks down to the low peaks.

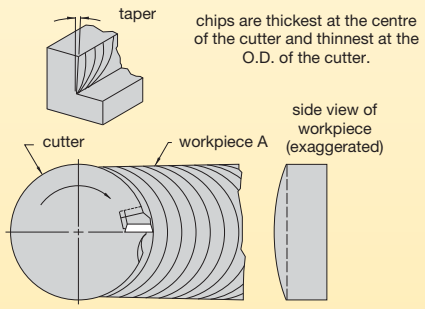

Figure 4: A taper is produced from the high peaks to the low ones.

Flatness also affects part tolerance. This effect is more predominant in side milling both sides of a part as shown in figure 5.

An obvious solution to obtaining a more consistent and improved surface finish with a minimum of taper is to reduce or flatten the peaks between feed marks. This can be done by introducing an insert with a corner configuration capable of wiping out or reducing these peaks. Shown in figure 5 is an exaggerated change in part width due to flatness and taper.

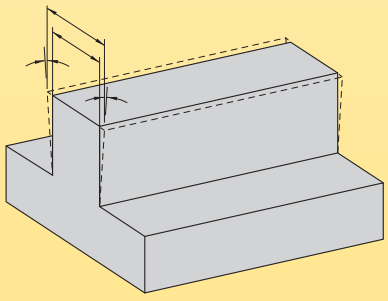

Figure 5: Flatness affects part tolerance more when milling both sides of a part.

(continued)

(continued)

Figures 6 and 7 compare the feed marks produced with a nose radius insert to those produced with a wiper insert. A wiper insert with a large radius for wiping out or reducing peaks (figure 7) has been effective in producing finishes below 2.5 Ra. Figures 6 and 7 show the wiper insert is designed to "top off" the peaks of the feed marks. An improved surface finish, surface flatness, and reduced taper will result.

Wiper inserts are normally set at 0,025–0,04mm above the highest positioned insert in the cutter to ensure a good wiping action. Kennametal wiper inserts are typically designed to fit into any pocket in the cutter body. This means one or more wiper inserts can be used. Interchangeable wipers can be used to share the load on the periphery of the cut in feed per tooth.

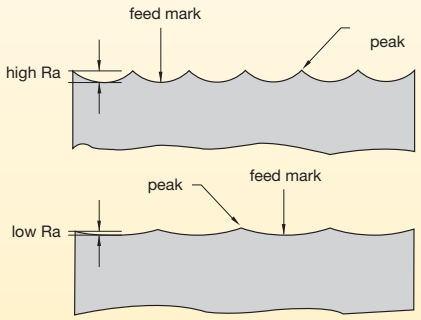

Figure 6: Peaks produced with a standard radii insert (top) compared to those produced with a large radius wiper insert (bottom).

Poor Surface Finish

cause	solution
cutter runout	Check for high insert, dirt in the pockets, or dirty spindle and cutter mounting face. Also, look for burs on the cutter and damaged cutter pocket.
worn or chipped insert	Index insert.
feed per revolution exceeding flat on wiper	Reduce feed rate or install wiper with greater effective insert facet width.
wiper insert is set too high	Set the wiper insert 0,025–0,04mm above highest insert.
chatter	Check rigidity of machine and table fixturing. Check arbour and spindle, adjust feed rates, adjust RPM, or reduce cut width. Consider cutter with fewer pockets.

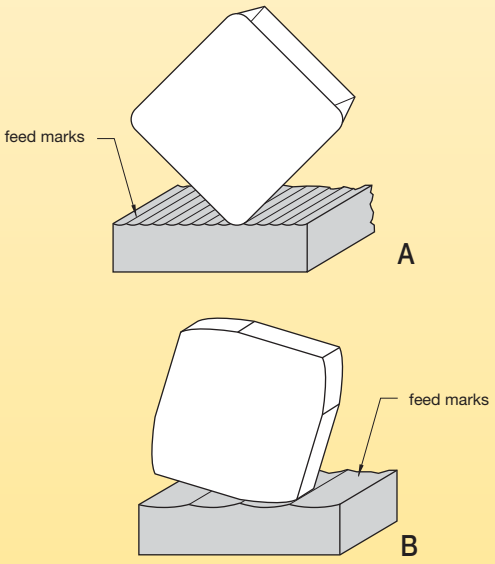

Figure 7: Feed marks produced with a nose radius insert (A) compared to marks produced with a wiper insert (B).

Measuring Finish Produced in a Milling Operation

Do not rely on your eye or fingernail to determine surface finish. Fingernails are about 25 times as thick as the stylus tip of a surface measuring instrument. They will skid across surface peaks, missing the valleys. Use a surface measuring instrument since the appearance of the surface finish may be deceiving. For example, reflected light on a uniformly milled surface pattern will look smoother than a random pattern. Also, a shiny surface will appear smoother than a dull surface.

Placement of the measuring device in a specific area on the milled surface will affect the reading. Also, a surface finish measured perpendicular to the feed direction is better than measuring parallel to the feed direction. This is usually the case regardless of workpiece condition and material (see figure 8).

Changing the cut-off width of the surface measuring instrument will affect the Ra value of the measurement.

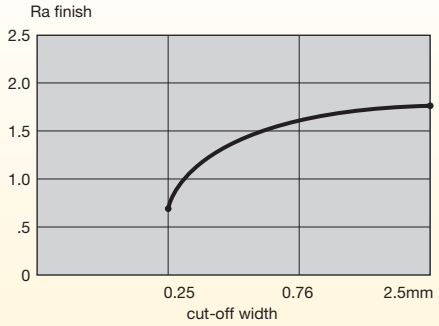

Figure 10: Finish quality is directly proportional to the cut-off width.

Surface Profile Record

Figure 9 shows the variation in roughness created by increasing the cut-off width on the instrument. The greater the cut-off, (see figure 9), the higher the Ra finish. For example, figure 10 illustrates that a 0,25mm cut-off width will produce a 0.6 Ra finish; whereas, a 0,76mm cut-off width will produce a 2.0 Ra finish.

Also, figure 10 demonstrates that most measuring devices are provided with 0,25mm, 0,76mm, and 2,54mm cut-offs. In most cases, the 0,76mm width cut-off is preferred.

Figure 11 shows the standard surface symbols specifying maximum and minimum roughness, waviness, and lay, which is the direction in which the measurement is taken.

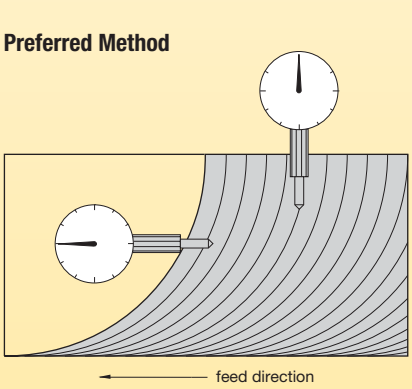

Figure 8: Measuring surface finish

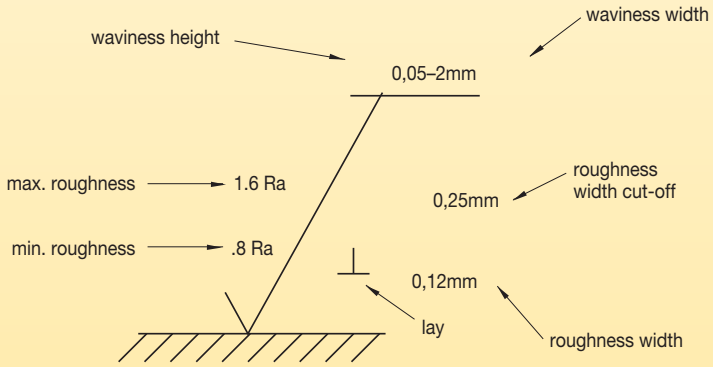

Figure 11: Standard surface symbols

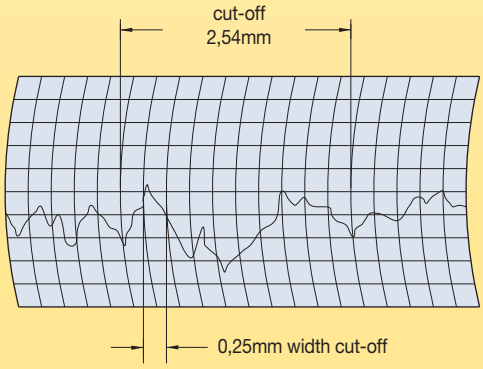

Figure 9: Increasing the cut-off width creates a variation in roughness.

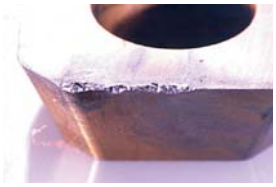
Troubleshooting Introduction

Troubleshooting should be performed in a sequential method to identify and solve your milling problems. These problems can be recognised as premature insert edge failure, part appearance, machine noise or vibration, and the cutter's appearance. Successful troubleshooting requires that we correctly identify the problem, then take the necessary corrective action one step at a time. The five key areas of concern are:

1. cutting tool material (grade)
2. cutter/adaptor
3. machine
4. workpiece
5. set-up/fixturing

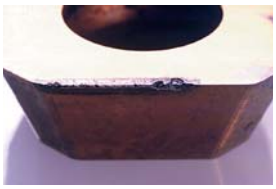
This section will discuss possible causes and will recommend corrective actions for each of the five areas listed. Remember, if more than one step is taken concurrently, the real cause of the problem may never be discovered. Always perform one corrective measure at a time.



Edge Condition Problems and Solutions

Chipping:

Appears like normal flank wear to the untrained eye. Actually, normal flank wear lands have a fine, smooth wear pattern, while a land formed by chipping has a saw-toothed, uneven surface. If chipping is not detected soon enough, it may be perceived as depth-of-cut notching.



Chipping can also be caused by recutting of chips. A good example of this would be a slotting operation where chip clearance or chip gullet space does not allow the chips to evacuate cleanly. In this instance, packing of the chips also occurs.

In most cases, by changing to a stronger grade and/or to a different edge preparation such as a larger hone or T-land, or from a 90° cutter geometry to a lead angle cutter geometry, will resolve the problem.

problem	cause	solution
chipping 	• chatter	• Check system rigidity for proper part clamping. • Correct worn gibs/bearings. • Check for improper cutter mounting.
	• edge prep	• Use largest hone or T-land possible.
	• grade	• Use a tougher grade.
	• built-up edge	• Increase speed.
	• feed	• Reduce feed per tooth.
	• recutting chips	• Choose cutter geometry with correct pitch for chip clearance. • Use air blast or coolant to remove chips.

Depth-of-cut notching:

Appears when chipping or localised wear at the depth-of-cut line on the rake face and flank of the insert occurs. Notching is primarily caused by the condition of the workpiece material. Material conditions prone to depth-of-cut notch include: an abrasive workpiece skin of scale, abrasive properties of high-temperature alloys like Inconel®, a work-hardened outer layer resulting from a previous machining operation, or heat-treated material above 55 HRC.

problem	cause	solution
depth-of-cut notching 	• cutter geometry	• Change to a lead angle cutter.
	• grade	• Use a more wear-resistant grade of carbide.
	• feed	• Reduce feed per tooth.
	• speed	• Reduce speed.
	• edge-prep	• Use honed or T-land inserts.
	• programming	• Vary depth of cut on very abrasive materials.

Thermal cracks:

These cracks run perpendicular to the insert's cutting edge and are caused by the extreme temperature variations involved in milling. In one revolution of a milling cutter, the insert starts to cut and the temperature quickly rises as the insert enters the cut. The varying chip thickness also changes the temperature throughout the cut. When the insert comes out of the cut, air or coolant flow rapidly cools the insert before it re-enters the cut.

These temperature variations create heat stresses in the insert which can result in thermal cracks. To the untrained eye, advanced thermal cracking could appear as chipping.

problem	cause	solution
thermal cracks 	• speed and feed	• Reduce cutting edge temperature by reducing the cutting speed and possibly the feed per tooth.
	• coolant	• Shut off coolant.
	• grade	• Use coated grade designed for wet milling.

Built-up edge:

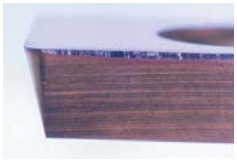
This condition involves the adhesion of layers of workpiece material to the top surface of the insert. Hardened pieces of the adhered material periodically break free, leaving an irregularly shaped depression along the cutting edge. This causes damage to the part and insert. Cutting forces also will be increased due to built-up edge.

problem	cause	solution
built-up edge 	• speed	• Increase SFM.
	• feed	• Increase feed per tooth.
	• coolant	• Use mist or flood coolant to avoid chips sticking to the insert when machining stainless steel and aluminium alloys.
	• grade	• Use sharp edge PVD inserts.
		• Higher speeds require diamond-tipped inserts or diamond-coated inserts on certain non-ferrous alloys.
	• edge-prep	• Use sharp edge, positive rake PVD inserts, or polished inserts.

Crater wear:

A relatively smooth, regular depression is produced on the insert's rake face. Crater wear occurs in two ways:

1. Material adhering to the insert's top surface is dislodged, carrying away minute fragments of the top surface of the insert.
2. Frictional heat builds up from the flow of chips over the top surface of the insert. Eventually, this heat buildup softens the insert behind the cutting edge and removes minute particles of the insert until a crater forms.



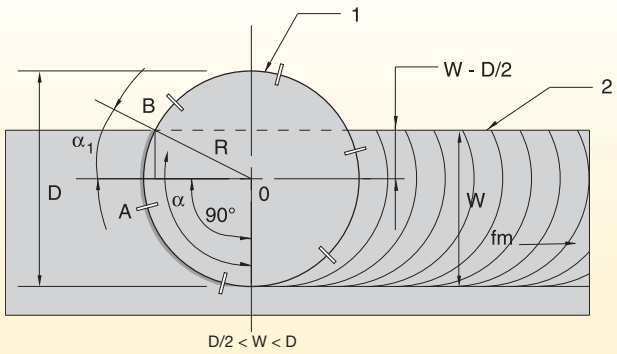
Crater wear is rarely encountered in milling, but can appear when machining certain steel and cast iron alloys. If crater wear becomes severe, there is a risk that the cutting edge will break, destroying the insert.

problem	cause	solution
crater wear 	• grade	• Use a more wear-resistant grade.
	• speed	• Reduce cutting speed.
	• edge-prep	• Use smaller T-land or increase feed to proper range for T-land.

Flank wear:

Uniform flank wear is the preferred method of insert failure because it can be predicted. Excessive flank wear increases cutting forces and contributes to poor surface finish. When wear occurs at an unacceptable rate or becomes unpredictable, the key elements that must be investigated are speed, feed, grade, and insert/cutter geometry.

NOTE: Inserts should be indexed for roughing applications when flank wear reaches 0,38–0,50mm. For finish applications, inserts should be indexed once flank wear reaches 0,25–0,38mm, if not sooner.



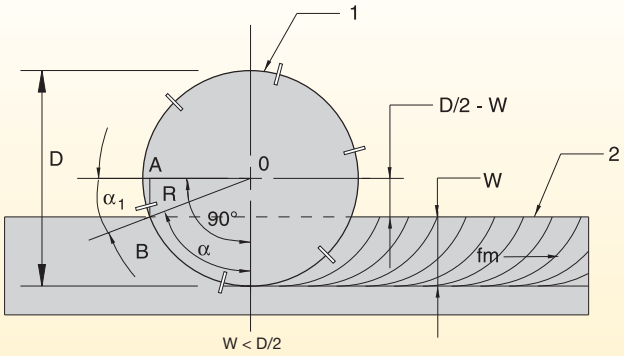
problem	cause	solution
flank wear 	• speed	• Check this area first. Recalculate SFM (Vc) to assure correctness. • Speed should be reduced without changing feed per tooth.
	• feed	• Increase feed per tooth (feed should be high enough to avoid the pure rubbing, which occurs with small chip thickness).
	• grade	• Use more wear-resistant grade. • Change to a coated grade if you are now using an uncoated grade.
	• insert geometry	• Inspect insert to determine if proper style is being used in the cutter.

Multiple factors:

When wear, chipping, thermal cracking, and breakage occur at once, the machine operator must look beyond the normal feed, speed, and depth-of-cut adjustments to find the root cause of the problem. Speed, feed, and depth-of-cut parameters should be re-examined for accuracy, but the system's rigidity should also be closely inspected for loose or worn parts as well.

problem	cause	solution
multiple factors 	• system rigidity	• Check system for loose cutter mounting. • Improve fixture and cutter rigidity. • Check for worn hardware or improper insert installation. • Reduce the gauge length of the cutter and arbour assembly.
	• feed	• Reduce feed rate to relieve cutting forces.
	• cutter geometry	• If possible, use a lead angle cutter to redirect cutting forces away from the insert nose.
	• insert/grade	• If possible, use a larger nose radius. • Use T-land insert. • Use a tougher grade of carbide.

Appendix • Engagement Angle and Number of Inserts in Cut



$$Z_c = \frac{Z \times \alpha^\circ}{360^\circ} \qquad \alpha = 90^\circ + \alpha_1$$

$$\sin \alpha_1 = \frac{AB}{OB} = \frac{W - D/2}{D/2} = \frac{2(W - D/2)}{D} = \frac{2W - D}{D};$$

$$\alpha_1 = \arcsin \frac{2W - D}{D};$$

$$Z_c = \frac{Z\left(90^\circ + \arcsin \frac{2W - D}{D}\right)}{360^\circ}$$

$$Z_c = \frac{Z \times \alpha^\circ}{360^\circ} \qquad \alpha = 90^\circ - \alpha_1$$

$$\sin \alpha_1 = \frac{AB}{OB} = \frac{D/2 - W}{D/2} = \frac{2(D/2 - W)}{D} = \frac{D - 2W}{D};$$

$$\alpha_1 = \arcsin \frac{D - 2W}{D}$$

$$Z_c = \frac{Z\left(90^\circ - \arcsin \frac{D - 2W}{D}\right)}{360^\circ}$$

D = cutter diameter
W = width of cut (woc)
α = engagement angle
α_1 = angle between cutter centreline and cutter radius to the peripheral point of exit or entry
Z = number of inserts in cutter
Z_c = number of inserts in cut

Service and Support

Customer Application Support (CAS)

Get Fast and Reliable Answers to Your Toughest Metalcutting Problems

Our Customer Application Support (CAS) Team is the metalworking industry's leading help desk resource for tooling application solutions and problem resolution.

Easy Access to Proven Metalworking Expertise!

Kennametal Customer Application Engineers assist customers and engineering groups throughout the world with expert tool selection and application recommendations for the entire range of Kennametal tooling.

SERVICE LEVEL EXCELLENCE	Fast telephone response. Quick technical solutions. Efficient case management.
SERVICES	Operating parameters. Process optimisation. Hardware support. Tooling selection. Troubleshooting.
BEST-IN-CLASS SUPPORT TOOLS AND TECHNOLOGY	Materials database. Application calculators. Tooling performance experts.
